

# W5100S

(W5100S-L & W5100S-Q) Version 1.2.1

### W5100S

W5100S designed with Hardwired TCP/IP, WIZnet Technology, is an embedded Internet Controller Chip. W5100S supporting Full Hardwired, Ethernet MAC (Media Access Control), and 10Base-T/100Base-TX Ethernet PHY is Internet Connectivity One-chip Solution for Internet Protocol (TCP/IP).

With W5100S, Host (User MCU) simply handles variety Internet Protocol such as IPv4, TCP, UDP, ICMP, IGMP, ARP, PPPoE and etc. And W5100S supports each 8KB Memory for Transmit and Receive to minimize using Memory on Low-end level Host. Host also independently uses 4 Hardwired SOCKETs to develop vary Internet Applications in each Hardwired SOCKETs.

W5100S supports SPI and Parallel System BUS Interface for Host Interface. It also provides Low Power / Low Heat design, WOL (Wake On LAN), Ethernet PHY Power Down Mode and etc.

W5100S is Low-cost chip that improves on W5100. Any Firmware using on W5100 can be used on W5100S without any modification. Also, W5100S has 48 Pin LQFP & QFN Lead-Free Package, smaller than W5100 for product miniaturization.

#### **Features**

- Support Hardwired Internet protocols
  - : TCP, UDP, WOL over UDP, ICMP, IGMPv1/v2, IPv4, ARP, PPPoE
- Support 4 independent SOCKETs simultaneously
- Support SOCKET-less Command
  - : ARP-Request, PING-Request
- Support Ethernet Power Down Mode & Main Clock Switching for power save
- Support Wake on LAN over UDP
- Support Serial & Parallel Host Interface
  - : High Speed SPI (MODE 0/3), System Bus with 2 Address signal & 8bit Data
- Internal 16Kbytes Memory for TX/ RX Buffers
- 10Base-T/100Base-TX Ethernet PHY Integrated
- Support Auto Negotiation (Full and Half Duplex, 10 and 100-based)
- Support Auto-MDIX only on Auto-Negotiation Mode
- Not support IP Fragmentation
- 3.3V operation with 5V I/O signal tolerance
- Network Indicator LEDs (Full/Half duplex, Link, 10/100 Speed, Active)
- 48 Pin LQFP & QFN Lead-Free Package (7x7mm, 0.5mm pitch)

### **Target Applications**

W5100S is well-suited for many embedded Applications, including:

- User product based on W5100 : No modify Firmware
- Home Network Devices: Set-Top Boxes, PVRs, Digital Media Adapters
- Serial-to-Ethernet: Access Controls, LED displays, Wireless AP relays, etc.
- Parallel-to-Ethernet: POS / Mini Printers, Copiers
- USB-to-Ethernet: Storage Devices, Network Printers
- GPIO-to-Ethernet: Home Network Sensors
- Security Systems: DVRs, Network Cameras, Kiosks
- Factory, Building, Home Automations
- Medical Monitoring Equipment
- Embedded Servers
- Internet of Thing (IoT) Devices
- IoT Cloud Devices

### 1 PIN Description

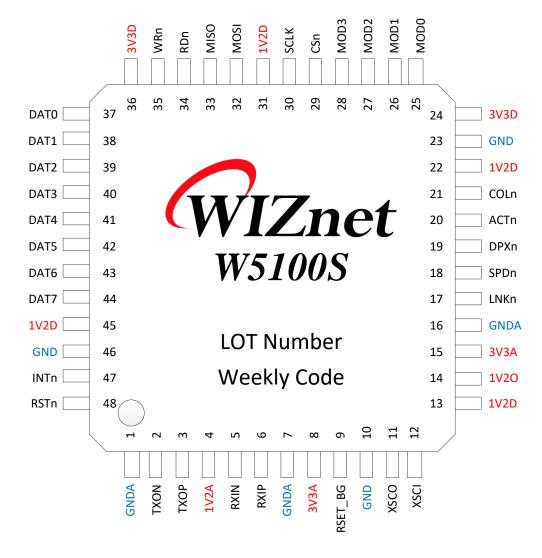

Figure 2 W5100S Pin Layout

Table 1 Pin Type Notation

Туре	Description			
I	Input			
O Output				
M Alternate (Multi-function) Signal				
U Internal pulled-up 75KΩ resistor				
D Internal pulled-down 75KΩ resistor				
A Analog				
P Power & Ground				

## 1.1 PIN Description

Table 2 PIN Description

PIN #	Symbol	Type	Description
1	GNDA	АР	•
			Analog Ground
2	TXON	AO	Differential Transmitted Signal Pair
3	TXOP	AO	Differential Data is transmitted to Media via TXOP/TXON
			signal pair on MDI Mode.
4	1V2A	AP	Analog 1.2V Power
			Supplied from 1V20 voltage source
5	RXIN	Al	Differential Received Signal Pair
6	RXIP	Al	Differential Data is received from Media via RXIP/RXIN
			signal pair on MDI Mode.
7	GNDA	AP	Analog Ground
8	3V3A	AP	Analog 3.3V Power
			Off-chip Bias Resistor
9	RSET_BG	AO	Must be connected to analog Ground through external
			12.3KΩ, error 1% Resistance.
10	GND	AP	Digital Ground
11	XSCO	AO	25MHz Clock
			25MHz Crystal Oscillator (TXAL) or Oscillator (OSC) are
			used for Internal oscillator stabilization.
			W5100S uses 25MHz (Low Frequency Mode) or 100MHz
42	VCCI	A 1	(Normal Mode) as Internal Clock from External 25MHz
12	XSCI	Al	Clock Source.
			If OSC is used, 25MHz@1.2V must be used and only XSCI
			must be connected and XSCO must be floated.
			For more information, refer to <u>Clock Selection Guide</u> .
		_	Digital 1.2V Power
13	1V2D	Р	Supplied from 1V20 voltage source
			Internal Regulator 1.2V Power Output
			Internal Regulator for W5100S needs Max 150mA for 1.2V
			Power Output.
	1V2O	PO	Make sure to supply 1V2D and 1V2A for External
14			Capacitor 3.3uF stabilization.
-			1V2O must use Ferrite Bead. 1V2D and 1V2A must be
			separated and be supplied.
			This power is only for W5100S. It must not be used for
			other device.
			outer device.

15	3V3A	AP	Analog 3.3V Power
16	GNDA	AP	Analog Ground
			Link Status LED
			It is valid on SPI and Parallel Bus Mode.
17	LNKn	OU	
			Low : Link up
			High: Link down
			Link Speed LED
			It is valid on SPI and Parallel Bus Mode.
18	SPDn	OU	
			Low: 100Mbps
			High: 10Mbps
			Link Duplex LED
			It is valid on SPI and Parallel Bus Mode.
19	DPXn	OU	
			Low: Full-Duplex
			High : Half-Duplex
			Link Activity LED
			It is valid on SPI and Parallel Bus Mode.
20	ACTn	OU	
			No Flash: Link up state without TX/RX
			Flash: Link up state with TX/RX data
			High: Link-down state
			Link Collision Detect LED
		OU	It is valid on SPI and Parallel Bus Mode.
21	COLn		It indicates a collision during Data transmission.
			Low: Collision Detected
			High: No Collision
22	1V2D	Р	Digital 1.2V Power
23	GND	Р	Supplied from 1V20 voltage source.
			Digital 3 2V power
24 25	3V3D	P ID	Digital 3.3V power W5100S Interface Mode Selection
26	MOD[0]	ID	Interface Mode is selected by MOD [3:0].
27	MOD[1] MOD[2]	ID	interface mode is selected by mob [3.0].
	MOD[2]	טו	"0000": SPI Mode
28	MOD[3]	ID	"010X" : Parallel Bus Mode
29	CSn	IU	W5100S Chip Select
-			<u>'</u>

_				
				Low: Select
_				High: No Select
				SPI Clock
	30	SCLK	ID	On SPI Mode, it is used to SPI Clock.
	30	JCLIK	10	But on Parallel Bus Mode, it must be connected to GND
_				or be floated.
	31	1V2D	P	Digital 1.2V Power
_	J1	1420	•	Supplied from 1V20 voltage source.
		MOSI		SPI Master Output Slave Input / Address 0
	32	/ADDR0	IDM	MOSI : On SPI Mode, SPI Data is received from HOST
_		/ ADDITO		ADDRO : On Parallel Bus Mode, it is used to Address 0
		MISO		SPI Master Input Slave Output / Address 1
	33	/ADDR1	IOPM	MISO : On SPI Mode, SPI Data is transmitted to HOST
_		/ ADDICT		ADDR1 : On Parallel Bus Mode, It is used to Address1
				Read Strobe
	34	RDn	IU	On Parallel Bus Mode, it indicates Read Operation
				On SPI Mode, it must be connected to 3V3D or be floated
	35	WRn	IU	Write Strobe
	33	WKII	IU	On Parallel Bus Mode, it indicates Write Operation.
	36	3V3D	Р	Digital 3.3V Power
	37	DAT0	IOU	8 Bits Data Bus
	38	DAT1	IOU	On Parallel Bus Mode, DAT [7:0] receives Data from HOST
	39	DAT2	IOU	or W5100S.
_	40	DAT3	IOU	
_	41	DAT4	IOU	On SPI Mode, DAT [7:0] must be floated.
_	42	DAT5	IOU	
_	43	DAT6	IOU	
_	44	DAT7	IOU	
-	45	1V2D	Р	Digital 1.2V Power
-	46	GND	Р	Digital Ground
_				Interrupt
				When the event occurs during W5100S Ethernet
				Communication, INTn notices to HOST.
	47	INTn	OP	Low : Interrupt Occurred
			0.	High: No Interrupt
				(Ref IEN (Interrupt pin Enable) in MR2 (Mode Register 2),
				INTPTMR (Interrupt Pending Time Register), IMR
-		l .	<u> </u>	<u> </u>

			(Interrupt Mask Register), IMR2 (Interrupt Mask Register
			2), SLIMR (SOCKET-less Interrupt Mask Register))
			Reset
			RSTn initializes W5100S. RSTn must be asserted to Low
			longer than 560ns. After asserted RSTn, W5100S spends
48	RSTn	IP	60.3ms for initialization. (Ref 7.4.1 Reset Timing)
			Low: W5100S initialized.
			High: Normal Operation.

### 2 Memory Map

W5100S has the same Memory Map as W5100 for compatibility and additional Common Register for improved functionality. The below Figure 3 shows W5100S Memory Map.

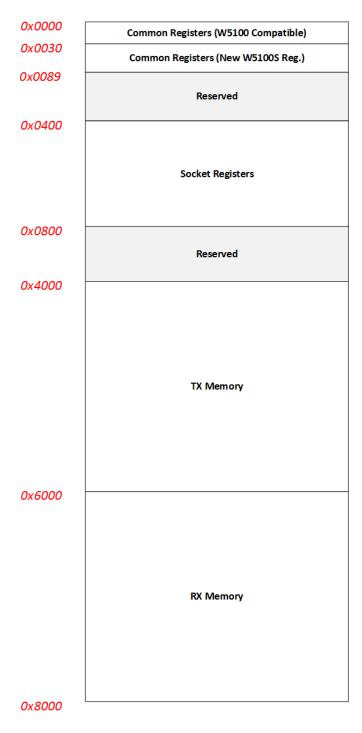

Figure 3 Memory Map

Figure 3 shows the Address Offset of Common & SOCKET Register Block and TX/RX Memory Block. At W5100S Reset, each SOCKET n TX/RX Buffer are assigned with 2KB/2KB from TX/RX Memory Block.

After W5100S Reset, each SOCKET n TX/RX Buffer Size are set by TMSR (TX Memory Size Register) and RMSR (RX Memory Size Register) or by SOCKET n TX/RX Buffer Size Register (Sn\_TXBUF\_SIZE / Sn\_RXBUF\_SIZE). The total Buffer Size of SOCKET n TX/RX must not be exceeded by 8 Kbytes.

## 2.1 W5100S Registers

## 2.1.1 Common registers

Table 3 Common Registers

Address	Register			
0x0000	Mode (MR)			
0x0001 0x0002	Gateway Address (GAR0)			
0x0002 0x0003 0x0004	(GAR1) (GAR2) (GAR3)

## 2.1.2 SOCKET Registers

Table 4 Socket Registers

		Table 4 Socket Registe	Add	ress		
Symbol	Description	Sn_	SO_	S1_	S2_	S3_
Sn_MR	SOCKET n Mode	0x0400+(0x0100 x n)	0x0400	0x0500	0x0600	0x0700
Sn_CR	SOCKET n Command	0x0401+(0x0100 x n)	0x0401	0x0501	0x0601	0x0701
Sn_IR	SOCKET n Interrupt	0x0402+(0x0100 x n)	0x0402	0x0502	0x0602	0x0702
Sn_SR	SOCKET n Status	0x0403+(0x0100 x n)	0x0403	0x0503	0x0603	0x0703
Sn_PORTR0	SOCKET n	0x0404+(0x0100 x n)	0x0404	0x0504	0x0604	0x0704
Sn_PORTR1	Source Port	0x0405+(0x0100 x n)	0x0405	0x0505	0x0605	0x0705
Sn_DHAR0		0x0406+(0x0100 x n)	0x0406	0x0506	0x0606	0x0706
Sn_DHAR1		0x0407+(0x0100 x n)	0x0407	0x0507	0x0607	0x0707
Sn_DHAR2	SOCKET n	0x0408+(0x0100 x n)	0x0408	0x0508	0x0608	0x0708
Sn_DHAR3	Destination Hardware Address	0x0409+(0x0100 x n)	0x0409	0x0509	0x0609	0x0709
Sn_DHAR4	1 1 2 1 2 1 2 2 2 2 2 2 2 2 2 2 2 2 2 2	0x040A+(0x0100 x n)	0x040A	0x050A	0x060A	0x070A
Sn_DHAR5		0x040B+(0x0100 x n)	0x040B	0x050B	0x060B	0x070B
Sn_DIPR0		0x040C+(0x0100 x n)	0x040C	0x050C	0x060C	0x070C
Sn_DIPR1	SOCKET n  Destination IP  Address	0x040D+(0x0100 x n)	0x040D	0x050D	0x060D	0x070D
Sn_DIPR2		0x040E+(0x0100 x n)	0x040E	0x050E	0x060E	0x070E
Sn_DIPR3	Address	0x040F+(0x0100 x n)	0x040F	0x050F	0x060F	0x070F
Sn_DPORTR0	SOCKET n	0x0410+(0x0100 x n)	0x0410	0x0510	0x0610	0x0710
Sn_DPORTR0	Destination Port	0x0411+(0x0100 x n)	0x0411	0x0511	0x0611	0x0711
Sn_MSS0	SOCKET n	0x0412+(0x0100 x n)	0x0412	0x0512	0x0612	0x0712
Sn_MSS1	Maximum Segment Size	0x0413+(0x0100 x n)	0x0413	0x0513	0x0613	0x0713
Sn_PROTOR	SOCKET n IP Protocol	0x0414+(0x0100 x n)	0x0414	0x0514	0x0614	0x0714
Sn_TOS	SOCKET n  IP Type Of Service	0x0415+(0x0100 x n)	0x0415	0x0515	0x0615	0x0715
Sn_TTL	SOCKET n IP Time To Live	0x0416+(0x0100 x n)	0x0416	0x0516	0x0616	0x0716
Reserved	Reserved	0x0417+(0x0100 x n)	0x0417	0x0517	0x0617	0x0717
Reserved	Reserved	0x041D+(0x0100 x n)	0x041D	0x051D	0x061D	0x071D
Sn_RXBUF_SIZE	SOCKET n RX Buffer Size	0x041E+(0x0100 x n)	0x041E	0x051E	0x061E	0x071E
Sn_TXBUF_SIZE	SOCKET n TX Buffer Size	0x041F+(0x0100 x n)	0x041F	0x051F	0x061F	0x071F
Sn_TX_FSR0	SOCKET n	0x0420+(0x0100 x n)	0x0420	0x0520	0x0620	0x0720

Sn_TX_FSR1	TX Free Size	0x0421+(0x0100 x n)	0x0421	0x0521	0x0621	0x0721
Sn_TX_RD0	SOCKET n	0x0422+(0x0100 x n)	0x0422	0x0522	0x0622	0x0722
Sn_TX_RD1	TX Read Pointer	0x0423+(0x0100 x n)	0x0423	0x0523	0x0623	0x0723
Sn_TX_WR0	SOCKET n	0x0424+(0x0100 x n)	0x0424	0x0524	0x0624	0x0724
Sn_TX_WR1	TX Write Pointer	0x0425+(0x0100 x n)	0x0425	0x0525	0x0625	0x0725
Sn_RX_RSR0	SOCKET n	0x0426+(0x0100 x n)	0x0426	0x0526	0x0626	0x0726
Sn_RX_RSR1	RX Received Size	0x0427+(0x0100 x n)	0x0427	0x0527	0x0627	0x0727
Sn_RX_RD0	SOCKET n	0x0428+(0x0100 x n)	0x0428	0x0528	0x0628	0x0728
Sn_RX_RD1	RX Read Pointer	0x0429+(0x0100 x n)	0x0429	0x0529	0x0629	0x0729
Sn_RX_WR0	SOCKET n	0x042A+(0x0100 x n)	0x042A	0x052A	0x062A	0x072A
Sn_RX_WR1	RX Write Pointer	0x042B+(0x0100 x n)	0x042B	0x052B	0x062B	0x072B
Sn_IMR	SOCKET n Interrupt Mask	0x042C+(0x0100 x n)	0x042C	0x052C	0x062C	0x072C
Sn_FRAGR0	SOCKET n	0x042D+(0x0100 x n)	0x042D	0x052D	0x062D	0x072D
Sn_FRAGR1	Fragment Offset in IP Header	0x042E+(0x0100 x n)	0x042E	0x052E	0x062E	0x072E
Sn_MR2	SOCKET n Mode 2	0x042F+(0x0100 x n)	0x042F	0x052F	0x062F	0x072F
Sn_KPALVTR	SOCKET n Keep-alive Timer	0x0430+(0x0100 x n)	0x0430	0x0530	0x0630	0x0730
Sn_RTR0	SOCKET n	0x0432+(0x0100 x n)	0x0432	0x0532	0x0632	0x0732
Sn_RTR1	Retransmission Time	0x0433+(0x0100 x n)	0x0433	0x0533	0x0633	0x0733
Sn_RCR	SOCKET n Retransmission Count	0x0434+(0x0100 x n)	0x0434	0x0534	0x0634	0x0734

### 3 Register Descriptions

#### Register Notation

- \* Register Symbol (Register full Name)
  - [Register Type][Address Offset][Reset Value]

Register Description....

7	6	5	4	3	2	1	0
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Bit Type							

Sn\_IR [3: 0] indicates a Register Symbol [Upper Bit: Lower Bit].

 $Sn_{R} [3: 0] = '0001' indicates Sn_{R} [3] = '0', Sn_{R} [2] = '0', Sn_{R} [1] = '0', Sn_{R} [0] = '1'.$ 

#### [Register/Bit Type]: Type of Register and Bit.

- [RW]: Both reading and writing are possible.
- [R=W]: The value read and written are the same.
- [RO]: Read Only
- [WO]: Write Only
- [W]: Write Only
- [WC]: Cleared by written '1'.
- [W0]: Must be written only '0'.
- [W1]: Must be written only '1'.
- [AC]: Auto Clear
- [1]: Always read '1'
- [0]: Always read '0'
- [-]: Not available

#### [Address Offset]: Register Address Offset

[Reset Value]: Default Value.

#### Ex1) 3.1.1 MR (Mode Register)

#### [RW][0x0000][0x03]

MR is abbreviation for Mode Register. This Register is possible to be read and written.

The Register Address Offset is '0x0000' and it is set to '0x03' after Reset.

7	6	5	4	3	2	1	0
RST	-	-	PB	PPPoE	-	Al	IND
AC	W0	W0	R=W	R=W	-	1	1

#### Ex2) MR [RST]

MR [RST] means RST Bit in MR.

#### Ex3) MR [7:0]

MR [7:0] means the Bits from 7<sup>th</sup> to 0<sup>th</sup> bit in MR.

### 3.1 Common Registers

## 3.1.1 MR (Mode Register)

[RW][0x0000] [0x03]

MR is used for Reset, PING Block and PPPoE Enable

7	6	5	4	3	2	1	0
RST	-	-	PB	PPPoE	-	-	-

Bit	Symbol	Description
		Reset
7	RST	If this Bit is '1', All W5100S Registers will be initialized.
		It will be automatically cleared as '0' after 3 SYS_CLK
[6:5]	-	Reserved
		PING Response Block
4	4 55	If this Bit is '1', it blocks the Response to a ping request.
4	РВ	1 : Disable PING Response
		0 : Enable PING Response
		PPPoE Enable
3	PPPoE	1 : Enable PPPoE
		0 : Disable PPPoE
[2:0]	-	Reserved

### 3.1.2 GWR (Gateway IP Address Register)

[R=W] [0x0001-0x0004] [0x00]

GWR configures the Gateway Address when NETLCKR (Network Lock Register) is on Unlock Mode.

Ex) GWR = "192.168.0.1"

GWR0(0x0001)	GWR1(0x0002)	GWR2(0x0003)	GWR3(0x0004)
192 (0xC0)	168 (0xA8)	0 (0x00)	1 (0x01)

### 3.1.3 SUBR (Subnet Mask Register)

[R=W] [0x0005-0x0008] [0x00]

SUBR configures the Subnet Mask Address when NETLCKR (Network Lock Register) is on Unlock Mode.

Ex) SUBR = "255.255.255.255"

SUBR0(0x0005)	SUBR0(0x0006)	SUBR0(0x0007)	SUBR0(0x0008)
---------------	---------------	---------------	---------------

255 (0xFF)	255 (0xFF)	255 (0xFF)	255 (0xFF)
------------	------------	------------	------------

### 3.1.4 SHAR (Source Hardware Address Register)

[R=W] [0x0009-0x000E] [0x00]

SHAR configures the Source MAC Address when NETLCKR (Network Lock Register) is on Unlock Mode.

Ex) SHAR = "11:22:33:AA:BB:CC"

SHAR0(0x0009)	SHAR1(0x000A)	SHAR2(0x000B)
0x11	0x22	0x33
SHAR3(0x000C)	SHAR4(0x000D)	SHAR5(0x000E)
0xAA	0xBB	0xCC

#### 3.1.5 SIPR (Source IP Address Register)

[R=W] [0x000F-0x0012] [0x00]

SIPR configures the Source IP Address when NETLCKR (Network Lock Register) is on Unlock Mode.

Ex) SIPR = "192.168.0.100"

SIPRO(x000F)	SIPR1(0x0010)	SIPR2(0x0011)	SIPR3(0x0012)
192 (0xC0)	168 (0xA8)	0 (0x00)	100(0x64)

# 3.1.6 INTPTMR (Interrupt Pending Time Register) [R=W][0x0013-0x0014][0x0000]

INTPTMR sets internal Interrupt Pending Timer Count. When INTn is de-asserted to High, Timer Count is initialized to INTPTMR and decreased by 1 from initial value to '0' every SYS\_CLK x 4. When Interrupt occurs and the corresponding Interrupt Mask is set and INTPTMR is '0', INTn is asserted to Low.

Ex) INTPTMR = 1000(0x03EB)

INTPTMR0(0x0013)	INTPTMR1(0x0014)
0x03	0xEB

## 3.1.7 IR (Interrupt Register) [RW] [0x0015] [0x00]

When W5100S or SOCKET n Event occurs, the corresponding Bit in IR is set to '1'. If the Event occurs and the corresponded Interrupt Mask Bit in IMR is set to '1' and internal Interrupt Pending Timer Counter is '0', INTn is asserted to Low. When the Event is cleared or the corresponding Mask Bit is set to '0', INTn is de-asserted to High.

7	6	5	4	3	2	1	0
CONFLICT	UNREACH	PPPTERM	-	S3_INT	S2_INT	S1_INT	S0_INT
WC	WC	WC	-	AC	AC	AC	AC

Bit	Symbol	Description
		IP Conflict
7	CONFLICT	Read 1: IP Conflict
		Read 0 : -
		Destination Port Unreachable
		When receiving the ICMP (Destination port unreachable) packet, this
		Bit is set as '1'. And Destination Information, IP Address and Port
6	UNREACH	Number, is written on UIPR & UPORTR.
		Read 1 : Unreachable Packet receive
		Read 0 : -
		PPPoE Terminated
5	PPPTERM	Read 1: Received PPPT or LCPT Packet only on PPPoE
		Read 0 : -
4	-	Reserved
		SOCKET n Interrupt
[3:0]	Sn_INT	Read 1: Each n-th Bit describes SOCKET n-th Interrupt.
		Read 0: When Sn_IR is 0x00, Sn_INT bit is Auto-Clear as '0'

# 3.1.8 IMR (Interrupt Mask Register) [R=W] [0x0016] [0x00]

IMR is used for the corresponding IR Bit Mask.

7	6	5	4	3	2	1	0
CNFT	UNREACH	PPPTERM	-	S3_INT	S2_INT	S1_INT	S0_INT
R=W	R=W	R=W		R=W	R=W	R=W	R=W

Bit	Symbol	Description
		IP Conflict Interrupt Mask
7	CNFT	1 : Enable IP Conflict Interrupt
		0 : Disable IP Conflict Interrupt
		Destination Port Unreachable Interrupt Mask
6	UNREACH	1 : Enable Destination Port Unreachable Interrupt
		0 : Disable Destination Port Unreachable Interrupt
5	PPPTERM	PADT/LCPT Interrupt Mask

		1 : Enable PADT/LCPT Interrupt
		0 : Disable PADT/LCPT Interrupt
4	-	Reserved
		SOCKET 3 Interrupt Mask
3	S3_INT	1 : Enable SOCKET 3 Interrupt
		0 : Disable SOCKET 3 Interrupt
		SOCKET 2 Interrupt Mask
2	S2_INT	1 : Enable SOCKET 2 Interrupt
		0 : Disable SOCKET 2 Interrupt
		SOCKET 1 Interrupt Mask
1	S1_INT	1 : Enable SOCKET 1 Interrupt
		0 : Disable SOCKET 1 Interrupt
		SOCKET 0 Interrupt Mask
0	S0_INT	1 : Enable SOCKET 0 Interrupt
		0 : Disable SOCKET 0 Interrupt

## 3.1.9 RTR (Retransmission Time Register)

[R=W] [0x0017-0x0018] [0x07D0]

RTR sets initial value of Sn\_RTR (SOCKET n Retransmission Time Register). The unit is 100us. RTR and RCR (Retransmission Counter Register) set ARP & TCP Retransmission.

(Ref 4.8 Retransmission)

Ex) RTR = 5000 (0x1388) 5000\*100us = 0.5s

RTR0(0x0017)	RTR1(0x0018)
0x13	0x88

# 3.1.10 RCR (Retransmission Count Register) [R=W] [0x0019] [0x08]

If Sn\_RCR(SOCKET n Retransmission Count Register) is '0', Sn\_RCR is initialized by RCR. RTR and RCR set ARP & TCP Retransmission. (Ref 4.8 Retransmission)

# 3.1.11 RMSR (RX Memory Size Register) [R=W] [0x001A] [0x55]

RMSR configures each SOCKET n RX Buffer Size. And the Sum of SOCKET n RX Buffer Size must not exceeded 8 Kbytes. (Ref Sn\_RXBUF\_SIZE (SOCKET n RX Buffer Size Register))

7	6	5	4	3	2	1	0
SOCK	ET 3	SOCK	(ET 2	SOCK	(ET 1	SOCI	KET 0

C 4	co	C 4	co	C 4	co	C 1	co
31	20	31	20	31	20	31	20

Each SOCKET n RX Buffer Size is set by S0 and S1.

Buffer Size	<b>S</b> 1	S0
1 KB	0	0
2 KB	0	1
4 KB	1	0
8 KB	1	1

# 3.1.12 TMSR (TX Memory Size Register) [R=W] [0x001B] [0x55]

TMSR configures each SOCKET n TX Buffer Block Size. And the sum of SOCKET n TX Buffer Block Size must not be exceeded 8 Kbytes. (Ref Sn\_TXBUF\_SIZE (SOCKET n TX Buffer Size Register))

7	6	5	4	3	2	1	0
SOC	KET 3	SOC	KET 2	SOC	KET 1	SOC	KET 0
<b>S</b> 1	S0	<b>S</b> 1	SO	<b>S</b> 1	SO	<b>S</b> 1	S0

Each SOCKET n TX Buffer Block Size is set by SO and S1.

Buffer Size	<b>S</b> 1	S0
1 KB	0	0
2 KB	0	1
4 KB	1	0
8 KB	1	1

# 3.1.13 IR2 (Interrupt Register 2) [RW] [0x0020] [0x00]

When WOL Event occurs, IR2 [WOL] is set to '1'. If the Event occurs and IMR2 [WOL] is set to '1' and internal Interrupt Pending Timer Counter is '0', INTn is asserted to Low. When the Event is cleared or IMR2 [WOL] is set to '0', INTn is de-asserted to High.

7	6	5	4	3	2	1	0
-	-	-	-	-	-	-	WOL
-	-	-	-	-	-	-	WC

Bit	Symbol	Description
[7:1]	-	Reserved
		WOL MAGIC Packet Interrupt
0	WOL	1 : Received UDP based WOL Magic Packet.
		0:-

### 3.1.14 IMR2 (Interrupt Mask Register 2)

[R=W] [0x0021] [0x00]

IMR2 is used for the corresponding IR2 Bit Mask.

7	6	5	4	3	2	1	0
-	-	-	-	•	-	•	WOL
-	-	-	-	-	-		R=W

Bit	Symbol	Description
[7:1]	-	Reserved
		WOL MAGIC Packet Interrupt Mask
0	WOL	1 : Enable WOL MAGIC Packet Interrupt
		0 : Disable WOL MAGIC Packet Interrupt

# 3.1.15 PTIMER (PPP Link Control Protocol Request Timer Register)

[R=W] [0x0028] [0x28]

PTIMER configures the sending period for LCP Echo Request. The unit is 25ms.

Ex) PTIMER = 200 (0xC8), 200 \* 25ms = 5s

# 3.1.16 PMAGIC (PPP Link Control Protocol Magic number Register)

[R=W] [0x0029] [0x00]

PMAGIC configures 4 Bytes Magic Number for LCP Echo Request.

Ex) PMAGIC = 0x01

PMAGIC(0x0029) 0x01

LCP Magic Number = 0x01010101

### 3.1.17 UIPR (Unreachable IP Address Register)

#### [RO] [0x002A-0x002D] [0x0000]

When W5100S received Unreachable Packet (IR [UNR] = '1'), Peer IP Address in the Packet is written on UIPR.

Ex) UIPR = "192.169.0.21"

UIPR0(0x002A)	UIPR1(0x002B)	UIPR2(0x002C)	UIPR3(0x002D)
192(0xC0)	168(0xA8)	0(0x00)	21(0x15)

### 3.1.18 UPORTR (Unreachable Port Register)

#### [RO] [0x002E-0x002F] [0x0000]

When W5100S received Unreachable Packet (IR [UNR] = '1'), Peer PORT Number in the Packet is written on UPORTR.

Ex) UPORTR = 3000 (0x0BB8)

UPORTR0(0x002E)	UPORTR1(0x002F)	
0x0B	0xB8	

#### 3.1.19 MR2 (Mode Register 2)

#### [R=W] [0x0030] [0x40]

MR2 configures System Operation Clock (SYS\_CLK), Interrupt Activation, TCP & UDP Scan Prevention, WOL (Wake On LAN) and Force ARP.

7	6	5	4	3	2	1	0
CLKSEL	IEN	NOTCPRST	UDPURB	WOL	-	FARP	-
R=W	R=W	R=W	R=W	R=W	W0	R=W	W0

Bit	Symbol	Description			
		System Operation Clock(SYS_CLK) Select When CLKLCKR (Clock Lock Register) is Unlock, this bit can only set.  (Ref 3.1.41 CLKLCKR (Clock Lock Register)  [WO] [0x0070] [0x00])			
7	CLKSEL	1: 25MHz 0: Depends on PHYCR1[PWDN] SYS_CLK selected by PHCR1 configuration.			
		PHYCR1[PWDN] SYS_CLK			
			0	100 MHz	

		1	25 MHz		
		INTn Enable / Disable			
6	IEN	1 : INTn Enable			
		0 : INTn Disable (INTn is Always High)			
		TCP RST Packet Block			
		If Peer transmits TCP Packet to a P	ort that does not exist on W5100S.		
		W5100S automatically transmits RS7	Packet. But it could be the target		
		for Port Scan Attack.			
5	NOTCPRST	But if this Bit is set as '1', W5100S do	oes not transmit RST Packet against		
		Peer TCP Packet having wrong port.			
		1 : Block sending RST Packet			
		0 : Normal			
		UDP Port Unreachable Packet Bloc			
		If Peer transmits UDP Packet to a P			
		W5100S automatically transmits ICMP Packet (Destination Port			
		Unreachable) to Peer. But it could I	-		
4	UDPURB	But if this Bit is set as '1', W5100	OS does not transmit ICMP Packet		
		(Destination Port Unreachable).			
		1: Block sending ICMP Packet (Dest	ination Port Unreachable Message)		
		0 : Normal	<b>5</b> ,		
		Wake On LAN			
		This Bit decides receiving WOL Pack	ket.		
3	WOL	-			
		1 : Receive WOL			
		0 : No Receive WOL			
2	-	Reserved			
		Force ARP			
		UDP Mode SOCKET transmits ARP F	Request once before the first UDP		
		Data Packet when it sends Data cor	ntinuously to the same Peer. But if		
1	FARP	this Bit is set to '1', it sends ARP Re	equest for every UDP Data Packet.		
		1 : Transmit ARP Request for every	LIDD Data Dackot		
		0 : Normal	טטו טמנמ ו מכתכנ		
	<u> </u>	Reserved			
		NGSCI YEU			

# 3.1.20 PHAR (Destination Hardware Address Register on PPPoE) [R=W] [0x0032-0x0037] [0x0000]

PHAR configures PPPoE Server Hardware Address only on PPPoE.

Ex) PHAR = "11:22:33:AA:BB:CC"

PHAR0(0x0032)	PHAR1(0x0033)	PHAR2(0x0034)
0x11	0x22	0x33
PHAR3(0x0035)	PHAR4(0x0036)	PHAR5(0x0037)
0xAA	0xBB	0xCC

# 3.1.21 PSIDR (Session ID Register on PPPoE) [R=W] [0x0038-0x0039] [0x0000]

PSID configures PPPoE Sever Session ID on PPPoE.

Ex) PSIDR = 0x1234

PSIDR0(0x0038)	PSIDR1(0x0039)
0x12	0x34

# 3.1.22 PMRUR (PPPoE Maximum Receive Unit Register) [R=W] [0x003A-0x003B] [0xFFFF]

PMRUR configures MRU (Maximum Receive Unit) on PPPoE and the value must not be exceeded 1472. If it is set bigger than 1472, it is configured 1472. And also PMRUR must be configured before SOCKET OPEN (Sn\_CR [OPEN] = '1').

Ex) PMUR = 1000 (0x03E8)

PMUR0(0x0038)	PMUR1(0x0039)
0x03	0xE8

## 3.1.23 PHYSR0 (PHY Status Register0)

[RO] [0x003C] [0x00]

PHYSR0 indicates PHY Operation Mode and LINK status configured by PHYCR0 (PHY Control Register 0)

7	6	5	4	3	2	1	0
CABOFF	-	AUTO	SPD	DPX	FDPX	FSPD	LINK
RO		RO	RO	RO	RO	RO	RO

Bit	Symbol	Description
7	CABOFF	Cable OFF Bit
/		1 : Cable Unplugged

		0 : Cable Plugged
6	-	Reserved
		Auto Negotiation Bit configured by PHYCR0[2]
5	AUTO	1 : Disable Auto Negotiation
		0 : Enable Auto Negotiation
		Speed Bit configured by PHYCR0[1]
4	SPD	1:10Mbps
		0:100Mbps
		Duplex Bit configured by PHYCR0[0]
3	DPX	1 : Half Duplex
		0 : Full Duplex
		Flag Duplex Bit (When Link up)
2	FDPX	1 : Half Duplex
		0 : Full Duplex
		Flag Speed Bit (When Link up)
1	FSPD	1:10Mbps
		0:100Mbps
		Flag Link Bit
0	LNK	1 : Link Up
		0 : Link Down

### 3.1.24 PHYSR1 (PHY Status Register 1)

### [RO][0x003D][0x81]

PHYSR1 indicates PHY Active state, received RX Page, LPI Mode and Calibrate.

7	6	5	4	3	2	1	0
ACT					RXP	LPI	CAL
RO					RO	RO	RO

Bit	Symbol	Description	
		PHY Act	
7	ACT	1 : PHY Act	
		0 : PHY No Act	
[6:3]	-	Reserved	
RX PAGE		RX PAGE	
2	RXP	1 : A New Page Received	
		0 : A New Page is not Received	
1	LPI	LPI(Low Power Idle) Mode	
'	LPI	1 : Enable LPI Mode	

		0 : Disable LPI Mode	
		Calibrate Done	
0	CAL	1 : Calibration is Removed	
		0 : Normal	

## 3.1.25 PHYRAR (PHY Register Address Register)

[R=W] [0x003F] [0x00]

PHYRAR configures PHY Register Address of Internal Ethernet PHY.

7	6	5	4	3	2	1	0
-	-	-	A4	А3	A2	A1	Α0
			R=W	R=W	R=W	R=W	R=W

Bit	Symbol	Description	
[7:5]	-	Reserved	
[4:0]	A[4:0]	PHY Register Address	

### 3.1.26 PHYDIR (PHY Data Input Register)

[R=W] [0x0040-0x0041] [0x0000]

PHTDIR writes PHY Register specified by PHYAR.

Ex) PHYDIR = 0x1234

PHYDIR0(0x0040)	PHYDIR1(0x0041)
0x34	0x12

### 3.1.27 PHYDOR (PHY Data Output Register)

[RO] [0x0042-0x0043] [0x0000]

PHYDOR reads the PHY Register specified by PHYAR

Ex) PHYDOR = 0x1234

PHYDOR0(0x0042)	PHYDPR1(0x0043)
0x34	0x12

# 3.1.28 PHYACR (PHY Access Control Register) [AC] [0x0044] [0x00]

PHYACR configures Access Type of PHY Register specified by PHYAR

Access Type	Value
-------------	-------

Write	0x01
Read	0x02

#### 3.1.29 PHYDIVR (PHY Division Register)

#### [R=W] [0x0045] [0x01]

Internal Ethernet PHY uses the divided Clock of System Operation Clock (SYS\_CLK). And this divided Clock must not be exceeded 2.5MHz.

Value	Value Divider SYS_CLK=100MHz		SYS_CLK=25MH
0x00	1/32	3.125MHz (N/A)	781.25KHz
0x01	1/64	1.5625MHz	390.625KHz
others	1/128	781.25KHz	195.3125KHz

### 3.1.30 PHYCR0 (PHY Control Register 0)

#### [WO] [0x0046] [0x00]

PHYCR configures Ethernet PHY Operation Mode such as Auto Negotiation, Speed and Duplex. Before set PHYCR, PHYLCKR (PHY Lock Register) must be on Unlock Mode.

7	6	5	4	3	2	1	0
-	-	-	-	-	MODE2	MODE1	MODE0
					WO	WO	WO

Bit	Symbol	Description					
[7:3]	-	Reserved	Reserved				
		MODE2	MODE1	MODE0	Description		
	[2:0] MODE	0	Х	X	Auto Negotiation		
[2.0]		1	0	0	100BASE-TX FDX		
[2.0]		1	0	1	100BASE-TX HDX		
		1	1	0	10BASE-TX FDX		
		1	1	1	10BASE-TX HDX		

## 3.1.31 PHYCR1 (PHY Control Register 1)

#### [R=W] [0x0047] [0x41]

PHYCR configures Ethernet PHY Operation Mode such as PHY Power Down Mode, PHY Reset. Before set PHYCR, PHYLCKR (PHY Lock Register) must be on Unlock Mode.

7	6	5	4	3	2	1	0
WOL	-	PWDN	-	-	-	-	Reset

W0	W0	R=W	W0	W0	W0	W0	AC	
								1

Bit	Symbol	Description				
7	WOL	Wake On LAN  To receive WOL Packet, PHYCR1[WOL] and MR2[WOL] must be set by  '1'.  1: Receive WOL Packet  0: No Receive WOL Packet				
6	-	Reserved	WOLTACKET			
5	PWDN	PHY Power Down  1: Enable Power Down Mode and SYS_CLK switching 25MHz  0: Disable Power Down Mode and SYS_CLK selected by MR2[CLKSEL]  MR2[CLKSEL] SYS_CLK  0 100 MHz  1 25 MHz  (Ref 7.4.1 Reset Timing)				
[4:1]	-	Reserved				
0	RST	PHY Reset cor	t Bit is set to '0', S\ npleted(PHYSR1[AC S_CLK is turn back	T]='1'), this Bit is	automatically	

# 3.1.32 SLCR (SOCKET-less Command Register) [RW] [0x004C] [0x00]

SLCR configures ARP and PING Request Transmission Command. Each Command must not be executed at the same time and not configured before SLCR cleared. The results of each Command is shown via SLIR (SOCKET-less Interrupt Register)

7	6	5	4	3	2	1	0
-	-	-	-	-	-	ARP	PING
-	-	-	-	-	-	AC	AC

Bit	Symbol	Description
[7:2]	-	Reserved
		ARP Request Transmission Command
1	ARP	1 :Transmit ARP packet
		0 : Ready
		PING Request Transmission Command
0	PING	1: Transmit PING Request
		0 : Ready

## 3.1.33 SLRTR (SOCKET-less Retransmission Time Register)

[R=W] [0x004D-0x004E] [0x07D0]

SLRTR sets SLCR Retransmission Time. The unit is 100us. If there is no Response for ARP or PING Request Packet transmitted by SLCR, W5100S automatically retransmits Request Packet every SLRTR. (Ref 4.8 Retransmission)

SLRTR0(0x004D)	SLRTR1(0x004E)	
0x013	0x88	

## 3.1.34 SLRCR (SOCKET-less Retransmission Count Register) [R=W] [0x004F] [0x00]

SLRCR sets SLCR Retransmission Number. If the number of Retransmission exceeds SLRCR, SOCKET-less Timeout (SLIR [TIMEOUT] = '1') occurs. (Ref 4.8 Retransmission)

## 3.1.35 SLPIPR (SOCKET-less Peer IP Address Register) [R=W] [0x0050-0x0053] [0x00000000]

SLPIPR configures Peer IP Address for ARP or Ping Request Packet transmitted by SLCR.

Ex) SLPIPR = "192.169.0.21"

SLPIPR0(0x0050)	SLPIPR1(0x0051)	SLPIPR2(0x0052)	SLPIPR3(0x0053)
192(0xC0)	168(0xA8)	0(0x00)	21(0x15)

# 3.1.36 SLPHAR (SOCKET-less Peer Hardware Address Register) [RO] [0x0054-0x0059] [0x00000000000]

If W5100S received ARP Reply against SLCR [ARP] and SLIPR [ARP] is set to '1', Peer Hardware Address from ARP Reply is written on SLPHAR.

Ex) SLPHAR = "11:22:33:AA:BB:CC"

SLPHAR0(0x0054)	SLPHAR1(0x0055)	SLPHAR2(0x0056)
0x11	0x22	0x33
SLPHAR3(0x0057)	SLPHAR4(0x0058)	SLPHAR5(0x0059)
0xAA	0xBB	0xCC

### 3.1.37 PINGSEQR (PING Sequence-number Register)

[R=W] [0x005A-0x005B] [0x0000]

PINGSEQR configures Sequence Number for PING Request Packet and it is not automatically increased.

Ex) PINGSEQR = 1000 (0x03E8)

PINGSEQR0(0x005A)	PINGSEQR1(0x005B)
0x03	0xE8

### 3.1.38 PINGIDR (PING ID Register)

[R=W] [0x005C-0x005D] [0x0000]

PINGIDR configures ID for PING Request Packet.

Ex) PINGIDR = 256 (0x0100)

PINGIDR0(0x005C)	PINGIDR1(0x005D)
0x01	0x00

# 3.1.39 SLIMR (SOCKET-less Interrupt Mask Register) [R=W] [0x005E] [0x00]

SLIMR is used for corresponding SLIR (SOCKET-less Interrupt Register) Bit Mask.

7	6	5	4	3	2	1	0
-	-	-	•	-	TIMEOUT	ARP	PING
-	-	-	-	-	R=W	R=W	R=W

Bit	Symbol	Description	
[7:3]	-	Reserved	
		TIMEOUT Interrupt Mask	
2	TIMEOUT	1 : Enable TIMEOUT Interrupt	
		0 : Disable TIMEOUT Interrupt	
		ARP Interrupt Mask	
1	ARP	1 : Enable ARP Interrupt	
		0 : Disable ARP Interrupt	

		PING Interrupt Mask
0	PING	1 : Enable PING Interrupt
		0 : Disable PING Interrupt

### 3.1.40 SLIR (SOCKET-less Interrupt Register)

#### [RW] [0x005F] [0x00]

When SOCKET-less Event occurs, the corresponding Bit in SLIR is set to '1'. If the Event occurs and the corresponded Interrupt Mask Bit in SLIMR is set to '1' and internal Interrupt Pending Timer Counter is '0', INTn is asserted to Low. When the Event is cleared or the corresponding Mask Bit is set to '0', INTn is de-asserted to High.

7	6	5	4	3	2	1	0
-	-	-	-	-	TIMEOUT	ARP	PING
-	-	-	-	-	WC	WC	WC

Bit	Symbol	Description
[7:3]	-	Reserved
2	TIMEOUT	TIMEOUT Interrupt
	TIMEOUT	When TIMEOUT occurs, this Bit is set to '1'.
1	ARP	ARP Interrupt
I	ARP	When ARP Reply received, this Bit is set to '1'.
0	PING	PING Interrupt
U	PING	When PING Reply received, this Bit is set to '1'.

### 3.1.41 CLKLCKR (Clock Lock Register)

#### [WO] [0x0070] [0x00]

CLKLCKR status must be Unlock to set MR2 [CLKSEL]. Before HOST changes CLKLCKR status, CLKLCKR has the previous status.

Unlock	Lock
0xCE	Others

### 3.1.42 NETLCKR (Network Lock Register)

#### [WO] [0x0071] [0x00]

NETLCKR status must be Unlock to set GWR, SUBR, SHAR and SIPR. Before HOST changes NETLCKR status, LETLCKR has the previous status.

Unlock
--------

#### 3.1.43 PHYLCKR (PHY Lock Register)

[WO] [0x0072] [0x00]

PHYLCKR status must be Unlock to set PHYCR0 and PHYCR1. Before HOST changes PHYLCKR status, PHYLCKR has the previous status.

Unlock	Lock
0x53	Others

#### 3.1.44 VERR (Version Register)

- [RO] [0x0080] [0x51]

VERR shows W5100S Version.

#### 3.1.45 TCNTR (Ticker Counter Register)

[RO][0x0082-0x0083][0x0000]

TCNTR is W5100S Internal Counter, it has automatically increased since SYS\_CLK operating. The unit is 100us.

# 3.1.46 TCNTCLR (Ticker Counter Clear Register) [W0][0x0088][0x00]

With TCNTCLR Write Access, TCNTR Counter value is initialized.

### 3.2 SOCKET Register

### 3.2.1 Sn\_MR (SOCKET n Mode Register)

[R=W] [0x0000+0x0100\*(n+4)] [0x00]

Sn\_MR configures SOCKET Mode and Option. Sn\_MR must be set before SOCKET OPEN (Sn\_CR [OPEN] = '1').

7	6	5	4	3	2	1	0
MULTI	MF	ND / MC	-	Р3	P2	P1	Р0
R=W	R=W	R=W	-	R=W	R=W	R=W	R=W

Bit	Symbol	Description
		UDP Multicast
		This Bit is valid only on UDP Mode. (Ref 4.4.3 UDP Multicast)
7	MULTI	
		1 : Enable UDP Multicast
		0 : Disable UDP Multicast
		MAC Filter Enable
		This Bit is valid only on MACRAW Mode.
		If This Bit is set to '1', W5100S block all Packets without Multicast,
6	MF	Broadcast and the Packets no having Source MAC (SHAR).
		1 : Enable MAC Filter.
		0 : Disable MAC Filter
		No Delayed ACK (ND)
		This Bit is valid only on TCP Mode.
		If this Bit is set to '1', TCP Mode SOCKET transmits ACK Packet without
		waiting RTR after receiving Data Packet from Peer.
		1 : Enable No Delayed ACK
		0 : Disable No Delayed ACK
5	ND / MC	
J	11,5 / ///	Ref) After Sn_CR[RECV] Command operating, If TCP Mode SOCKET
		Window Size is smaller than MSS, it sends ACK packet immediately. (no
		concerned with ND Bit)
		Multicast IGMP Version (MC)
		This Bit is valid only on UDP Multicast Mode (Sn_MR[3:0] = 'UDP' &
		Sn_MR[MULTI] = '1')

			0: Using IGMP version 2 1: Using IGMP version 1					
4	-	Reserv						
					Protocol	Mode.	MACRAW Mode is used only v	
[3:0]	P[3:0]		Р3	P2	P1	P0	Protocol Mode	
[3:0]	P[3:0]		P3 0	P2 0	P1 0	P0 0	Protocol Mode SOCKET Closed	
[3:0]	P[3:0]							
[3:0]	P[3:0]		0	0	0	0	SOCKET Closed	
[3:0]	P[3:0]		0	0	0	0	SOCKET Closed TCP	

# 3.2.2 Sn\_CR (SOCKET n Command Register) [RW][AC] [0x0001+0x0100\*(n+4)] [0x00]

Sn\_CR configures SOCKET n Command. After W5100S executes SOCKET Command, the corresponding Sn\_CR Bit is automatically cleared. Next SOCKET Command must be configured after previous SOCKET Command Bit cleared.

Value	Symbol	Description					
		SOCKET OPEN Command  Before OPEN Command, HOST mus  After OPEN Command done, Sn_SR s	t be set SOCKET Mode with Sn_MR. shows SOCKET Status.				
001	ODEN	Sn_MR (P[3:0])	Sn_SR				
0x01	OPEN	Sn_MR_CLOSE ('0000')	SOCK_CLOSED (0x00)				
		Sn_MR_TCP ('0001')	SOCK_INIT (0x13)				
		Sn_MR_UDP ('0010')	SOCK_UDP (0x22)				
				Sn_MR_IPRAW ('0011')	SOCK_IPRAW (0x32)		
		S0_MR_MACRAW ('0100')	SOCK_MACRAW (0x42)				
		TCP LISTEN Command					
0x02	LISTEN	After LISTEN Command, TCP Mode	SOCKET waits for SYN Packet from				
0.02	LISTLIN	Peer for TCP Connection in SOCK_IN	IIT (Sn_SR = '0x13').				
		(Ref 4.3.1 TCP Server)					
		TCP CONNECT Command					
0x04	CONNECT	After CONNECT Command, TCP Mo	de SOCKET transmits SYN Packet to				
		Peer for TCP Connection in SOCK_IN	IIT (Sn_SR = '0x13').				

		(Ref 4.3.2 TCP Client)
		TCP DISCON Command
80x0	DISCON	After DISCON Command, TCP Mode SOCKET transmits FIN Packet to Peer
		for TCP Disconnection in SOCK_ESTABLESHED (Sn_SR = '0x17') or
		SOCK_CLOSE_WAIT (Sn_SR = '0x1C').
		SOCKET CLOSE Command
0x10	CLOSE	After CLOSE Command, SOCKET is closed (Sn_SR = '0x00').
		*Caution: Sn_SR is changed to SOCK_CLOSE without FIN Packet sending in TCF
		Mode
		SOCKET SEND Command
		After SEND Command, SOCKET sends Data as much as the calculated size
		between Sn_TX_WR (SOCKET n TX Write Point Register) and Sn_TX_RD
		(SOCKET n RX Read Pointer Register). The Sent Data must not be
		exceeded Sn_RX_FSR (SOCKET n TX Free Buffer Size Register). HOST
		must execute next SEND Command after Sn_IR [SENDOK] is set to '1'.
	SEND	On TCP and UDP Mode, if the calculated size is over MSS (Maximun
		Segment Size), Data is separated by MSS and sent.
0x20		On the other hands, on IPRAW and MACRAW Mode, if Data is over MSS
		HOST must separate it by less than MSS.
		On TCP Mode, if Peer receives Data (It means TCP Mode SOCKET receives
		ACK Packet from Peer), Sn_RX_FSR is automatically increased by sen
		Data Size. But if not, Sn_IR [TIMEOUT] is set to '1' and Sn_SR is changed
		to SOCK_CLOSED.
		On LIDD, IDDAW and MACRAW Made, Co. TV, ECD is increased by cont. Date
		On UDP, IPRAW and MACRAW Mode, Sn_TX_FSR is increased by sent Data
		Size after Sn_IR [SENDOK] is set to '1'.
		SOCKET SEND_MAC Command
		SEND_MAC Command is used only on UDP and IPRAW Mode. Only the
0x21	SEND_MAC	different with SEND Command is that it skips ARP Process. Before using
		SEND_MAC Command, HOST must set Sn_DHAR (SOCKET n Destination
		Hardware Address Register) with Peer MAC Address.
		SOCKET SEND_KEEP Command
		SEND_KEEP Command is used only on TCP Mode. Before using SEND_KEEI
0x22	SEND_KEEP	Command, TCP Mode SOCKET must send more than 1 byte Data to Peer
		After SEND_KEEP Command, TCP Mode SOCKET continues to send Keep
		alive (KA) Packet and check the TCP connection. If there is no Pee

		response, KA Packet is retransmitted. After Retransmission Time, Sn_IR
		[TIMEOUT] is set to '1' and Sn_SR is changed to SOCK_CLOSED.
		(Ref 4.3.3.2 Keep AliveKeep )
		SOCKET RECV Command
		After reading received Data from SOCKET n RX Buffer Block, HOST
		updates Sn_RX_RD (SOCKET n Read Pointer Register) with RECV
		Command.
0x40	RECV	Commune.
(Ref 3.2.18 Sn_RX_RSR (SOCKET n RX Received Size Registe		(Ref 3.2.18 Sn_RX_RSR (SOCKET n RX Received Size Register), 3.2.20
		Sn_RX_WR (SOCKET n RX Write Pointer Register), 3.2.16 Sn_RX_RD
		(SOCKET n RX Read Pointer Register))

# 3.2.3 Sn\_IR (SOCKET n Interrupt Register) [RW] [0x0002+0x0100\*(n+4)] [0x00]

When Sn\_IR Event occurs, the corresponding Interrupt Bit is set to '1'.

7	6	5	4	3	2	1	0
-	-	-	SENDOK	TIMEOUT	RECV	DISCON	CON
			WC	WC	WC	WC	WC

Bit	Symbol	Description
[7:5]	-	Reserved
		SEND OK Interrupt
4	SENDOK	1 : When SEND Command is completed
		0 : When others
		TIMEOUT Interrupt
3	TIMEOUT	1 : When the number of retransmission is exceeded Sn_RCR (SOCKET
J	TIMEOUT	Retransmission Count Register) in ARP or TCP communication.
		0 : When others
	RECV	RECEIVED Interrupt
2		1 : When SOCKET received Data or Data still remained in SOCKET n RX
L		Buffer Block after Sn_CR [RECV]
		0 : When others
		DISCONNECTED Interrupt
1	DISCON	1: When FIN Packet sent and disconnection completed, or When FIN
'	DISCON	Packet received or RST Packet received.
		0 : When others
0	CON	CONNECTED Interrupt
	CON	1: When TCP Connection is successfully done. (Sn_MR [3:0]='TCP)

0: When others

### 3.2.4 Sn\_SR (SOCKET n Status Register)

[RO] [0x0003+0x0100\*(n+4)] [0x00]

Sn\_SR describes the Status of SOCKET. Sn\_SR is set by Sn\_CR or Data transmit/receive.

Value	Symbol	Description
0x00	SOCK_CLOSED	SOCKET Closed
0x13	SOCK_INIT	SOCKET Opened as TCP Mode
0x14	SOCK_LISTEN	SOCKET is TCP Mode and wait for Peer Connection
0x17	SOCK_ESTABLISHED	SOCKET is TCP Mode and TCP Connection is done
0x1C	SOCK_CLOSE_WAIT	SOCKET is TCP Mode and received disconnection request
0x22	SOCK_UDP	SOCKET Opened as UDP Mode
0x32	SOCK_IPRAW	SOCKET Opened as IPRAW Mode
0x42	SOCK_MACRAW	SOCKET Opened as MACRAW Mode

The below table shows a temporary status indicated during changing the status of SOCKET n.

Value	Symbol	Description			
0x15	SOCK_SYNSENT	SOCKET n sent the Connect request			
0x16	SOCK_SYNRECV	SOCKET n received the Connect request			
0x18	SOCK_FIN_WAIT				
0X1B	SOCK_TIME_WAIT	SOCKET n is in SOCKET Closed			
0X1D	SOCK_LAST_ACK				

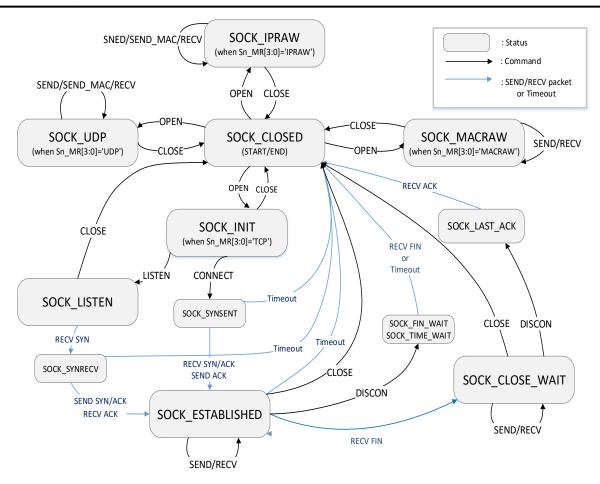

Figure 4 State Diagram

### 3.2.5 Sn\_PORTR (SOCKET n Source Port Register)

[R=W] [0x0004+0x0100\*(n+4), 0x0005+0x0100\*(n+4)] [0x0000]

Sn\_PORTR configures Source Port Number of SOCKET n.

Ex)  $SO_PORTR = 5000 (0x1388)$ 

S0_PORTR0(0x0404)	S0_PORTR1(0x0405)	
0x013	0x88	

# 3.2.6 Sn\_DHAR (SOCKET n Destination Hardware Address Register)

[RW] [0x0006+0x0100\*(n+4), 0x0007+0x0100\*(n+4), 0x0008+0x0100\*(n+4), 0x0009+0x0100\*(n+4), 0x000A+0x0100\*(n+4), 0x000B+0x0100\*(n+4)] [0x00000000000]

Peer MAC Address in Peer Packet is written on Sn\_DHAR. On TCP Mode, Sn\_DHAR is valid after CONNECT Command. On UDP and IPRAW Mode, Sn\_DHAR is valid after SEND Command.

If HOST uses SEND\_MAC Command, Sn\_DHAR must be set with Peer MAC Address before Command. On UDP Multicast Mode, Sn\_DHAR must be configured with Multicast Group MAC

Address. (Ref 4.4.3 UDP Multicast)

Ex) S0\_DHAR = "11:22:33:AA:BB:CC"

S0_DHAR0(0x0406)	S0_DHAR1(0x0407)	S0_DHAR2(0x0408)
0x11	0x22	0x33
S0_DHAR3(0x0409)	S0_DHAR4(0x040A)	S0_DHAR5(0x040B)
0xAA	0xBB	0xCC

# 3.2.7 Sn\_DIPR (SOCKET n Destination IP Address Register) [RW] [0x000C+0x0100\*(n+4), 0x000D+0x0100\*(n+4), 0x000E+0x0100\*(n+4), 0x000F+0x0100\*(n+4)] [0x00000000]

Sn\_DIPR is set with Peer IP Address. On TCP Mode, Sn\_DIPR must be set with Peer IP Address before Connection, or indicates IP Address of connected Peer. On UDP and IPRAW Mode, Sn\_DIPR must be set with Peer IP Address before sending Data.

On UDP Multicast Mode, Sn\_DIPR must be configured with Multicast Group IP Address. (Ref 4.4.3 UDP Multicast)

On UDP, UDP Multicast and IPRAW Mode, Peer IP Address is stored with Data in SOCKET n RX Buffer.

Ex) S0\_DIPR = "192.168.0.11"

S0_DIPR0(0x040C)	S0_DIPR1(0x040D)	S0_DIPR2(0x040E)	S0_DIPR3(0x040F)
192 (0xC0)	168 (0xA8)	0 (0x00)	11 (0x0B)

# 3.2.8 Sn\_DPORTR (SOCKET n Destination Port Register) [R=W] [0x0010+0x0100\*(n+4), 0x0011+0x0100\*(n+4)] [0x0000]

Sn\_DPORTR is set with Peer Port Number. On TCP Mode, Sn\_DPORTR must be set with Peer Port Number before Connection, or indicates Port Number of connected Peer. On UDP and IPRAW Mode, Sn\_DPORTR must be set with Peer Port Number before sending Data.

On UDP Multicast Mode, Sn\_DPORTR must be configured with Multicast Group Port Number. (Ref 4.4.3 UDP Multicast)

On UDP, UDP Multicast and IPRAW Mode, Peer Port Number is stored with Data in SOCKET n RX Buffer.

#### Ex) $SO_DPORTR = 5000 (0x1388)$ ,

S0_DPORTR0(0x0410)	S0_DPORTR1(0x0411)
0x13	0x88

# 3.2.9 Sn\_MSS (SOCKET n Maximum Segment Size Register) [R=W] [0x0012+0x0100\*(n+4), 0x0013+0x0100\*(n+4) [0xFFFF]

Sn\_MSS sets SOCKET n MSS and it must be set before Sn\_CR [OPEN]. Sn\_MSS must not be exceeded specified size as below table.

Mode	Normal (MR [PPPoE]='0') Range	PPPoE (MR [PPPoE]='1') Range
ТСР	1~1460	1~1452
UDP	1~1472	1~1464
IPRAW	1480	1472
MACRAW	1514	

Ex)  $S0_MSS = 1460 (0x05B4)$ ,

S0_MSS0(0x0412)		S0_MSS1(0x0413)
	0x05	0xB4

#### 3.2.10 Sn\_PROTOR (SOCKET n IP Protocol Register)

[R=W] [0x0014+0x0100\*(n+4)] [0x0000]

Sn\_PROTOR configures Protocol Number (Ref  $\underline{IANA\_Protocol\ Number}$ ) of IP Header except for TCP (0x06), UDP (0x11) and IGMP (0x01).

On IPRAW Mode, only the Protocol configured in Sn\_PROTR can be transmitted and received.

Ex) ICMP (Internet Control Message Protocol) = 0x01

# 3.2.11 Sn\_TOS (SOCKET n IP Type Of Service Register) [R=W] [0x0015+0x0100\*(n+4)] [0x00]

Sn\_TOS configures the TOS (Type Of Service) of IP Header. (Ref <a href="IANA\_IP Parameters">IANA\_IP Parameters</a>)

# 3.2.12 Sn\_TTL (SOCKET n IP Time To Live Register) [R=W] [0x0016+0x0100\*(n+4)] [0x80]

Sn\_TTL configures TTL (Time To Live) of IP header. (Ref <u>IANA\_IP Parameters</u>)

# 3.2.13 Sn\_RXBUF\_SIZE (SOCKET n RX Buffer Size Register) [RW] [0x001E+0x0100\*(n+4)] [0x02]

Sn\_RXBUF\_SIZE configures SOCKET n RX Buffer Size as 0, 1, 2, 4 and 8 Kbytes. RX Memory is sequentially allocated from SOCKET 0 to SOCKET 3. The total sum of Sn\_RXBUF\_SIZE must not be exceeded 8 Kbytes. Sn\_RXBUF\_SIZE can also be configured by RMSR.

Value (Dec)	0	1	2	4	8
Buffer size	0KB	1KB	2KB	4KB	8KB

Ex) SO\_RXBUF\_SIZE = 8KB

S0_RXBUF_SIZE(0x041E)	
0x08	

# 3.2.14 Sn\_TXBUF\_SIZE (SOCKET n TX Buffer Size Register) [RW] [0x001F+0x0100\*(n+4)] [0x02]

Sn\_TXBUF\_SIZE configures SOCKET n TX Buffer Size as 0, 1, 2, 4 and 8 Kbytes. TX Memory is sequentially allocated from SOCKET 0 to SOCKET 3. The total sum of Sn\_TXBUF\_SIZE must not be exceeded 8 Kbytes. Sn\_TXBUF\_SIZE can also be configured by RMSR.

Value (Dec)	0	1	2	4	8
Buffer size	0KB	1KB	2KB	4KB	8KB

Ex) SO\_TXBUF\_SIZE= 4KB

S0\_TXBUF\_SIZE(0x041F)

0x04

### 3.2.15 Sn\_TX\_FSR (SOCKET n TX Free Size Register) [R0] [0x0020+0x0100\*(n+4), 0x0021+0x0100\*(n+4)] [0x0800]

Sn\_TX\_FSR indicates SOCKET n TX Free Buffer Size.

In UDP, IPRAW and MACRAW mode,

Sn\_TX\_FSR = | Sn\_TX\_WR<sup>(1)</sup> - Sn\_TX\_RD<sup>(2)</sup> | + 1

In TCP mode,

Sn\_TX\_FSR = | Sn\_TX\_WR - Internal Pointer<sup>(3)</sup> | + 1

- (1) SOCKET n TX Write Pointer Register
- (2) SOCKET n TX Read Pointer Register
- (3) TCP ACK Pointer managed by W5100S

Data to be stored in SOCKET n TX Buffer must not be bigger than Sn\_TX\_FSR.

 $Ex) SO_TX_FSR = 1024 (0x0400)$ 

S0_TX_FSR0(0x0420)	S0_TX_FSR1(0x0421)
0x04	0x00

### 3.2.16 Sn\_TX\_RD (SOCKET n TX Read Pointer Register)

[RO] [0x0022+0x0100\*(n+4), 0x0023+0x0100\*(n+4)] [0x0000]

Sn\_TX\_RD indicates the last Data Address in SOCKET n TX Buffer Block after transmitting. Sn\_TX\_RD is initialized by Sn\_CR [OPEN]. On TCP Mode, Sn\_TX\_RD is re-configured in TCP Connection Process. By Sn\_CR [SEND] and Sn\_CR [SEND\_MAC], Sn\_TX\_WR (SOCKET n TX Write

Pointer Register) is increased to Data Size. After transmitting Data, Sn\_TX\_RD increases by Sn\_TX\_WR and Sn\_IR [SENDOK] occurs.

Ex)  $SO_TX_RD = 0xd4b3$ 

S0_TX_RD0(0x0422)	S0_TX_RD1(0x0423)
0xd4	0xb3

### 3.2.17 Sn\_TX\_WR (SOCKET n TX Write Pointer Register)

[RW] [0x0024+0x0100\*(n+4), 0x0025+0x0100\*(n+4)] [0x0000]

Sn\_TX\_WR indicates the last stored Data Address in SOCKET n TX Buffer Block. Sn\_TX\_RD is initialized by Sn\_CR [OPEN]. On TCP Mode, Sn\_TX\_RD is re-configured in TCP Connection Process. Before Sn\_CR [SEND] and Sn\_CR [SEND\_MAC], Sn\_TX\_WR must be set as transmitting Data Size.

**Ex)**  $S0_TX_WR = 0x0800$ 

S0_TX_WR0(0x0424)	S0_TX_WR1(0x0425)
0x08	0x00

#### 3.2.18 Sn\_RX\_RSR (SOCKET n RX Received Size Register)

[RO] [0x0026+0x0100\*(n+4), 0x0027+0x0100\*(n+4)] [0x0000]

Sn\_RX\_RSR indicates received Data Size in SOCKET n RX Buffer Block.

In TCP, UDP, IPRAW and MACRAW mode,  $Sn_RX_RSR = | Sn_RX_WR^{(1)} - Sn_RX_RD^{(2)} |$ 

- (1) SOCKET n RX Write Pointer Register
- (2) SOCKET n RX Read Pointer Register

 $Ex) SO_RX_RSR = 2048 (0x0800)$ 

S0_RX_RSR0(0x0426)	S0_RX_RSR1(0x0427)
0x08	0x00

### 3.2.19 Sn\_RX\_RD (SOCKET n RX Read Pointer Register)

[RW] [0x0028+0x0100\*(n+4), 0x0029+0x0100\*(n+4)] [0x0000]

Sn\_RX\_RD is the last Data Address read by HOST in SOCKET n RX Buffer Block. HOST is available to read Data from Sn\_RX\_RD to Sn\_RX\_WR in SOCKET n RX Buffer Block. After setting Sn\_RX\_RD as much as Data read, HOST must set Sn\_CR [RECV] to update Sn\_RX\_RD.

Ex)  $S0_RX_RD = 1536(0x0600)$ 

S0_RX_RD0(0x0428)	S0_RX_RD1(0x0429)
0x06	0x00

### 3.2.20 Sn\_RX\_WR (SOCKET n RX Write Pointer Register)

[RO] [0x002A+0x0100\*(n+4), 0x002B+0x0100\*(n+4)] [0x0000]

Sn\_RX\_WR is the last received Data Address in SOCKET n RX Buffer Block. If received Data is smaller than Sn\_RX\_RSR, it is stored in SOCKET n RX Buffer Block and Sn\_RX\_WR increases by stored Data Size.

Ex)  $S0_RX_WR = 1536(0x0600)$ 

S0_RW_WR0(0x042A)	S0_RW_WR1(0x042B)
0x06	0x00

# 3.2.21 Sn\_IMR (SOCKET n Interrupt Mask Register) [R=W] [0x002C+0x0100\*(n+4)] [0xFF]

Sn\_IMR is used for the corresponding Sn\_IR Bit Mask.

7	6	5	4	3	2	1	0
-	-	-	SENDOK	TIMEOUT	RECV	DISCON	CON
-	-	-	R=W	R=W	R=W	R=W	R=W

Bit	Symbol	Description
[7:5]	-	Reserved
4	SENDOK	Sn_IR[SENDOK] Interrupt Mask
3	TIMEOUT	Sn_IR[TIMEOUT] Interrupt Mask
2	RECV	Sn_IR[RECV] Interrupt Mask
1	DISCON	Sn_IR[DISCON] Interrupt Mask
0	CON	Sn_IR[CON] Interrupt Mask

# 3.2.22 Sn\_FRAGR (SOCKET n Fragment Offset in IP Header Register)

[R=W] [0x002D+0x0100\*(n+4), 0x002E+0x0100\*(n+4)] [0x4000]

 $Sn\_FRAGR$  configures Fragment Offset in IP Header.

Ex) S0\_FRAG0 = 0x0000 (Don't Fragment)

S0_FRAGR0(0x042D)	S0_FRAGR1(0x042E)
0x00	0x00

### 3.2.23 Sn\_MR2 (SOCKET n Mode register 2)

### [R=W] [0x002F+0x0100\*(n+4)] [0x00]

 $Sn\_MR2$  configures SOCKET n Option.  $Sn\_MR2$  must be set before  $Sn\_CR[OPEN] = '1'$ .

7	6	5	4	3	2	1	0
-	MBBLK	MMBLK	IPV6BLK	-	-	BRDB	UNIB
-	R=W	R=W	R=W	-	-	R=W	R=W

Bit	Symbol	Description
7	-	Reserved
		Broadcast Blocking on MACRAW Mode
		On MACRAW Mode, this Bit is set to '1' to block Broadcast Packet.
6	MBBLK	
		0 : Disable Broadcast Blocking
		1 : Enable Broadcast Blocking
		Multicast Blocking on MACRAW Mode
		On MACRAW Mode, this Bit is set to '1' to block Multicast Packet.
5	MMBLK	
		0 : Disable Multicast Blocking
		1 : Enable Multicast Blocking
		IPv6 Packet Blocking on MACRAW Mode
4	IPV6BLK	On MACRAW Mode, this Bit is set '1' to block IPv6 Packet.
4	IPVODLK	0 : Disable IPv6 Blocking
		1 : Enable IPv6 Blocking
[3:2]	_	Reserved
[0]		Broadcast Blocking on UDP Mode/ Force PSH on TCP Mode
		*Broadcast Blocking on UDP Mode
		On UDP Mode, this Bit is set '1' to block UDP Broadcast Packet.
		0 : Disable Broadcast Blocking
		1 : Enable Broadcast Blocking
1	BRDB	
		* Force PSH on TCP Mode
		On TCP Mode, this Bit is set to '1' to set PSH Flag in all transmitting
		Data Packet.
		1: Force PSH Flag
		0: No Force PSH Flag

-		Unicast Blocking on UDP Multicast Mode
		On UDP Multicast Mode, this Bit is set to '1' to block UDP Unicast
0	UNIB	Packet.
		0 : Disable Unicast Blocking
		1 : Enable Unicast Blocking

# 3.2.24 Sn\_KPALVTR (SOCKET n Keep Alive Timer Register) [R0] [0x0030+0x0100\*(n+4)] [0x00]

Sn\_KPALVTR sets 'Keep Alive (KA)' Packet transmission time. The unit is 5 sec. TCP Mode SOCKET transmits KA Packet every Sn\_KPALVTR. Before transmitting KA Packet, SOCKET must transmit Data (over 1 Byte) Packet at least once. By Sn\_CR [SENDKEEP], KA Packet is transmitted without Sn\_KPALVTR setting.

S0_KPALVRT(0x0430)
0x0A

# 3.2.25 Sn\_RTR (SOCKET n Retransmission Time Register) [R=W] [0x0032+0x0100\*(n+4), 0x0033+0x0100\*(n+4)] [0x0000]

Sn\_RTR sets SOCKET n Retransmission Time. If Sn\_RTR is zero, SOCKET n Retransmission Time is set by RTR. (Ref *4.8 Retransmission*)

S0_RTR0(x0432)	S0_RTR1(0x0433)
0x013	0x88

# 3.2.26 Sn\_RCR (SOCKET n Retransmission Count Register) [R=W] [0x0034+0x0100\*(n+4)] [0x00]

Sn\_RCR sets SOCKET n Retransmission Counter. If Sn\_RCR is zero, SOCKET n Retransmission Counter is set by RCR. (Ref 4.8 Retransmission)

### 4 Functional Description

W5100S provides Internet Connectivity with simple register control. In this chapter, the Initialization of W5100S, Data Communication method according to each TCP, UDP, IPRAW, MACRAW Mode and the additional functions are described step by step based on the pseudo code.

#### 4.1 W5100S RESET

- Set Hardware before Reset. (Ref 7.4.1 Reset Timing)
- Set HOST Interface Mode with MOD [3:0] pin.
- Supply the Reset signal longer than 500ns on RSTn pin for Hardware Reset.
- Wait for T<sub>STA</sub> (Ref 7.4.1 Reset Timing)

#### 4.2 Initialization

The Network Information and SOCKET n TX / RX buffer are set in the W5100S Initialization Process.

#### 4.2.1 Basic Setting

To operate the W5100S properly, set the following Registers according to User's Application.

- Mode Register (MR)
- Interrupt Mask Register (IMR)
- Retransmission Time Register (RTR)
- Retransmission Count Register (RCR)

More Information for the above registers can be found in each Register Descriptions.

#### 4.2.2 Network Information Setting

Set the basic Network Information for Internet Communication.

```
NETWORK SETTING:

{
    /* W5100S MAC Address, 11:22:33:AA:BB:CC */
    SHAR[0:5] = { 0x11, 0x22, 0x33, 0xAA, 0xBB, 0xCC };

    /* W5100S Gateway IP address, 192.168.0.1 */
    GAR[0:3] = { 0xC0, 0xA8, 0x00, 0x01 };
```

```
/* W5100S Subnet MASK Address, 255.255.255.0 */
SUBR[0:3] = { 0xFF, 0xFF, 0x00};

/* W5100S IP Address, 192.168.0.100 */
SIPR[0:3] = {0xC0, 0xA8,0x00, 0x64};
}
```

#### 4.2.3 SOCKET TX/RX Buffer Setting

Determine SOCKET n TX/RX Buffer Size using TMSR/RMSR or Sn\_TXBUF\_SIZE/Sn\_RXBUF\_SIZE. SOCKET n TX / RX Buffer is a RING-Buffer structure. So, calculation of the base address and MASK value for SOCKET n TX / RX Buffer control must be required.

Please make sure that the Sum of SOCKET n TX / RX Buffer Size must not be exceed 8 KB.

The pseudo-code for setting the SOCKET n TX/RX Buffer is described below.

```
In case of, assign 2KB TX/RX memory per SOCKET
  // set Base Address of TX/RX Memory for SOCKET n
  gSO_RX_BASE = 0x8000; // TX Memory Block Base Address
  gSO_RX_BASE = 0xC000; // RX Memory Block Base Address
  TxTotalSize = 0;
                         // For check the total size of SOCKET n TX Buffer
  RxTotalSize = 0; // For check the total size of SOCKET n RX Buffer
  for (n=0; n<3; n++) {
    Sn_TXBUF_SIZE = 2; // assign 2 Kbytes TX Memory per SOCKET
    Sn_RXBUF_SIZE = 2; // assign 2 Kbytes RX Memory per SOCKET
    // 0x07FF, for getting offset address within assigned SOCKET n TX/RX Memory
    gSn_TX_MASK = (1024 * Sn_TXBUF_SIZE) - 1;
    gSn_RX_MASK = (1024 * Sn_RXBUF_SIZE) - 1;
    if( n != 0) {
      gSn_TX_BASE = gSn_1_TX_BASE + (1024 * Sn_1_TXBUF_SIZE);
      gSn_RX_BASE = gSn_1_RX_BASE + (1024 * Sn_1_RXBUF_SIZE);
    } // end if
    TxTotalSize = TxTotalSize + Sn_TXBUF_SIZE;
    RxTotalSize = RxTotalSize + Sn RXBUF SIZE;
    If( TxTotalSize > 8 or RxTotalSize > 8 ) goto ERROR; // invalid Total Size
  } // end for
```

#### 4.3 TCP

TCP (Transmission Control Protocol) is a bidirectional Data Transmission Protocol based on a 1:1 communication on Transport Layer. It also provides Communication between Applications by using Port Number.

TCP 1:1 communication needs the Connection Process such as transmitting Connection Request to Peer or receiving Connection Request from Peer. In this Connection Process, the side transmitting Connection Request is 'TCP CLIENT' and the other side receiving Connection Request is 'TCP SERVER'. TCP also provides reliable, ordered and error-checked delivery of a stream Data between applications running on hosts communicating by an IP network.

'TCP SERVER' and 'TCP CLIENT' are maintaining transmit and receive Data until the TCP connection is terminated.

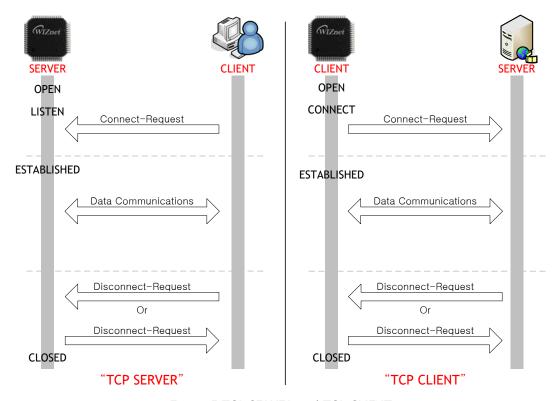

Figure 5 TCP SERVER and TCP CLIENT

#### 4.3.1 TCP Server

Figure 6 show 'TCP SERVER' Operation Flow.

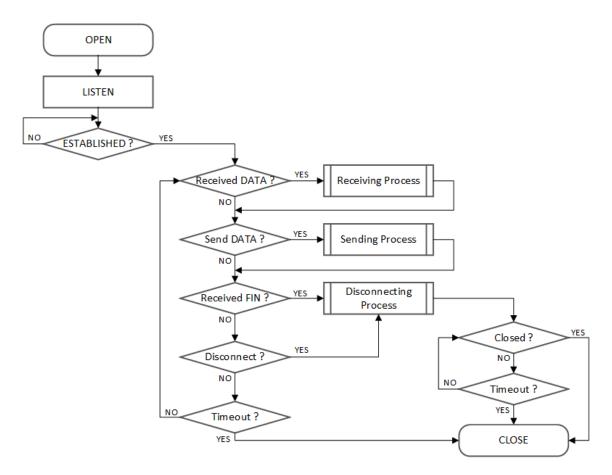

Figure 6 TCP Server Operation Flow

#### • OPEN

HOST configures SOCKET n to TCP Mode.

```
START:

Sn_MR[3:0] = '0001'; /* set TCP Mode */

Sn_PORTR[0:1] = {0x13,0x88}; /* set PORT Number, 5000(0x1388) */

/* configure SOCKET Option when you need it. */

// Sn_MR[ND] = '1'; /* set No Delay ACK */

Sn_CR[OPEN] = '1'; /* set OPEN Command */

while(Sn_CR != 0x00); /* wait until OPEN Command is cleared*/

if(Sn_SR != SOCK_INIT) goto START; /* check SOCKET Status */
```

}

#### LISTEN

SOCKET n is operated as 'TCP SERVER' by Sn\_CR [LISTEN]. 'TCP SERVER' waits for SYN Packet in Sn\_SR (SOCK\_LISTEN)

```
{
    Sn_CR = LISTEN; /* set LISTEN Command */
    while(Sn_CR != 0x00); /* wait until LISTEN Command is cleared*/
    if(Sn_SR != SOCK_LISTEN) goto OPEN; /* check SOCKET Status */
}
```

#### • ESTABLISHED?

'TCP SERVER' keeps Sn\_SR (SOCK\_LISTEN) until received SYN Packet. If 'TCP SERVER' receives SYN Packet from 'TCP CLIENT', it transmits SYN/ACK Packet to 'TCP CLIENT' and the Connection Process between 'TCP SERVER' and 'TCP CLIENT' is completed.

If there is no response from Peer against of transmitted SYN Packet or SYN/ACK Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

```
First method:

{

    /* check SOCKET Interrupt */
    if (Sn_IR[CON] == '1')
    {

         /* clear SOCKET Interrupt */
         Sn_IR[CON] = '1';
         goto Received DATA?; /* or goto Send DATA?; */
    }
    else if(Sn_IR[TIMEOUT] == '1') goto Timeout?;
}

Second method:
{

    if (Sn_SR == SOCK_ESTABLISHED)
    {

        /* clear SOCKET Interrupt */
        Sn_IR[CON] = '1';
        goto Received DATA? /* or goto Send DATA?; */
    }
```

```
else if(Sn_IR[TIMEOUT] == '1') goto Timeout?;
}
```

#### • Receive DATA?

Whether SOCKET n Data is received is confirmed by Sn\_IR [RECV] or Sn\_RX\_RSR.

#### • Receiving Process

Received Data is read from SOCKET n RX Buffer Block.

The Read Offset Address of Received Data in RX Memory Block is calculated by gSn\_RX\_BASE, gSn\_RX\_MASK and Sn\_RX\_RD. (Ref 4.2.3 SOCKET TX/RX Buffer Setting)

After reading received Data, Sn\_RX\_RD must be increased by Data read Size and Sn\_CR [RECV] must be set to '1'. If there is remain Data in SOCKET n RX Buffer Block after Sn\_CR [RECV] Command, Sn\_IR [RECV] is set to '1'.

When Read Offset Address calculated, it is cautious to over the boundary Address (n=0,1,2:  $gSn_RX_BASE \sim gSn+1_RX_BASE$ , n=3:  $gS3_RX_BASE \sim 0xFFFF$ ) of SOCKET n RX Buffer Block.

```
{
    /* get Received Size */
    get_size = Sn_RX_RSR;

    /* calculate SOCKET n RX Buffer Size & Offset Address */
    gSn_RX_MAX = Sn_RXBUF_SIZE * 1024;
    get_offset = Sn_RX_RD & gSn_RX_MASK;
```

```
/* calculate Read Offset Address */
    get_start_address = gSn_RX_BASE + get_offset;
    /* if overflow the upper boundary of SOCKET n RX Buffer */
    If( (get_offset + get_size) > gSn_RX_MAX )
      /* copy upper_size bytes of get_start_address to destination_address
        - destination_address is user Data Memory Address */
      upper_size = gSn_RX_MAX - get_offset;
      memcpy(get_start_address, destination_address, upper_size);
      destination_address += upper_size;
      /* copy the remained size bytes of gSn_RX_BASE to destination_address */
      remained_size = get_size - upper_size;
      memcpy(gSn_RX_BASE, destination_address, remained_size);
    }
    else
    {
      /* copy get_size of get_start_address to destination_address */
      memcpy(get_start_address, destination_address, get_size);
    }
    /* increase Sn_RX_RD as get_size */
    Sn_RX_RD += get_size;
    /* set RECV Command */
    Sn_CR[RECV] = '1';
    while(Sn_CR != 0x00); /* wait until RECV Command is cleared*/
}
```

#### Send DATA? / Sending Process

Written Data in SOCKET n TX Buffer Block is transmitted.

The Write Offset Address in TX Memory Block is calculated by gSn\_TX\_BASE, gSn\_TX\_MASK and Sn\_TX\_WD. (Ref *4.2.3 SOCKET TX/RX Buffer Setting*). And Data to be transmitted form the Write Offset Address is written. After writing Data, Sn\_TX\_WD must be increased by written Data Size and the Data is transmitted by Sn\_CR [SEND].

Before Sn\_IR [SENDOK] = '1', next Data Transmission Process is not executed. How long time until Sn\_IR [SENDOK] = '1' after transmitting Data is depending on SOCKET Count, Data Size and Network Traffic. Also Sn\_IR [TIMEOUT] could be occurred. (Ref 4.8.2 TCP Retransmission)

When Write Offset Address calculated, it is cautious to over the boundary Address (n=0,1,2:  $gSn_TX_BASE \sim gSn+1_TX_BASE$ , n=3:  $gS3_TX_BASE \sim 0xC000$ ) of SOCKET n TX Buffer Block. If there is no response from Peer against of transmitted Data Packet within the Retransmission Time,  $Sn_IR$  [TIMEOUT] is set to '1'.

```
{
  /* calculate SOCKETn TX Buffer Size & Offset Address */
  gSn_TX_MAX = Sn_TXBUF_SIZE * 1024;
  get_offset = Sn_TX_WR & gSn_TX_MASK;
  /* check the max size of DATA(send_size) & Free Size of SOCKETn TX
     Buffer(Sn_TX_FSR)*/
  if( send_size >gSn_TX_MAX ) send_size = gSn_TX_MAX;
  while(send <= Sn_TX_FSR); // Wait until SOCKET n TX Buffer is free */
  /* If you don't want to wait TX Buffer Free
    send_size = Sn_TX_FSR; // write Data as size of Free Buffer
  /* calculate Write Offset Address */
  get_start_address = gSn_TX_BASE + get_offset;
  /* if overflow the upper boundary of SOCKET n TX Buffer */
  If( (get_offset + send_size) > gSn_TX_MAX )
  {
    /* copy upper size bytes of source_address to get_start_address
      - source_address is the start address of user data */
    upper_size = gSn_TX_MAX - get_offset;
    memcpy(source_address, get_start_address, upper_size);
    /* copy the Remained Size Bytes of source_address to gSn_TX_BASE */
    source_address += upper_size;
    remained_size = send_size - upper_size;
    memcpy(source_address, gSn_TX_BASE, remained_size);
  }
  else
  {
    /* copy send_size bytes of source_address to get_start_address
     - source_address is the start address of user data */
```

```
memcpy(source_address, get_start_address, send_size);
}

/* increase Sn_TX_WR as send_size */
Sn_TX_WR += send_size;

/* set SEND Command */
Sn_CR = SEND;
while(Sn_CR != 0x00); /* wait until SEND Command is cleared*/

/* wait until SEND Command is completed or TIMEOUT Interrupt is occurred*/
while(Sn_IR[SENDOK] == '0' and Sn_IR[TIMEOUT] = '0');

/* clear SOCKET Interrupt*/
if(Sn_IR[SENDOK] == '1') Sn_IR[SENDOK] = '1';
else goto Timeout?;
}
```

#### • Received FIN (Passive Close)

When FIN Packet received from Peer.

```
First Method:
{
    If(Sn_SR == SOCK_CLOSE_WAIT) goto Disconnecting Process;
}
Second Method:
{
    If(Sn_IR[DISCON] == '1') goto Disconnecting Process;
}
```

#### • Disconnected (Active Close)

When FIN Packet transmitted to Peer.

```
{
    /* send FIN Packet */
    Sn_CR[DISCON] = '1';
    while(Sn_CR != 0x00); /* wait until DISCON Command is cleared*/
    goto Disconnecting Process;
}
```

#### • Disconnecting Process

In Passive Close, if FIN Packet is received from Peer and there is no Data to be transmitted, SOCKET transmits FIN Packet and it will be closed. If there is no response from Peer against of transmitted FIN Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

In Active Close, if SOCKET transmits FIN Packet to Peer, SOCKET waits for Peer FIN Packet. SOCKET will be closed after receiving FIN Packet from Peer. If there is no response from Peer against of transmitted FIN Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

```
Passive Close: /* received FIN Packet from Peer */
{
  /* send FIN Packet */
  Sn_CR = DISCON;
  while(Sn_CR != 0x00); /* wait until DISCON Command is cleared*/
  /* wait unit ACK Packet is received*/
  while(Sn_IR[DISCON] == '0' and Sn_IR[TIMEOUT] == '0');
  if (Sn_IR[DISCON] == '1')
  {
    /* clear Interrupt */
    Sn_IR[DISCON] = '1';
    goto CLOSED;
 }
  else goto Timeout?;
Active Close: /* sent FIN Packet to Peer */
  /* wait until FIN Packet is received*/
  while(Sn_IR[DISCON] == '0' and Sn_IR[TIMEOUT] == '0');
  if (Sn_IR[DISOCN] == '1')
  {
    /* clear Interrupt */
    Sn_IR[DISCON] = '1';
    goto CLOSED;
  }
  else goto Timeout?;
```

#### • Timeout?

If there is no response from Peer against of transmitted SYN or SYN/ACK or FIN or Data Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'. (Ref 4.8.2 TCP Retransmission)

```
{
    /* check TIMEOUT Interrupt */
    if(Sn_IR[TIMEOUT] == '1')
    {
        /* clear Interrupt */
        Sn_IR[TIMEOUT] = '1';
        goto CLOSE;
    }
}
```

#### • CLOSE

SOCKET n is closed by the Disconnect Process, Sn\_IR [TIMEOUT] = '1' and Sn\_CR [CLOSE] = '1'.

```
{
  /*wait until SOCKET n is closed*/
  while(Sn_SR != SOCK_CLOSED);
}
```

#### 4.3.2 TCP Client

Figure 7 shows 'TCP CLIENT' Operation Flow.

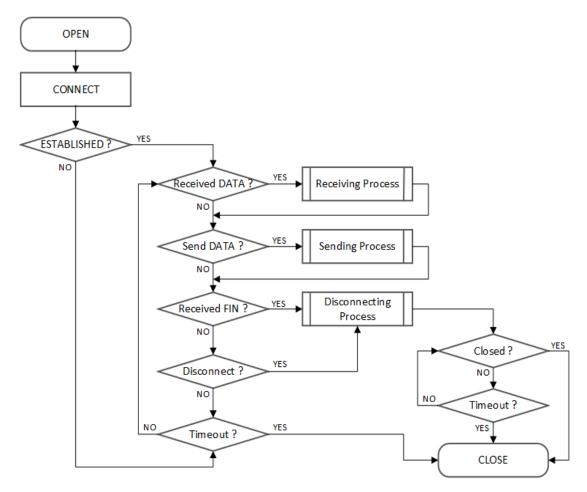

Figure 7 TCP Client Operation Flow

#### • OPEN

Refer to 4.3.1 TCP Server: OPEN

#### • CONNECT

SOCKET n is operated as 'TCP CLIENT' by Sn\_CR [CONNECT]. SYN Packet is transmitted to 'TCP SERVER' by Sn\_CR [CONNECT].

```
{
    /* set Destination IP Address, 192.168.0.11 */
    Sn_DIPR[0:3] ={ 0xC0, 0xA8, 0x00, 0x0B};

    /* set Destination PORT Number, 5000(0x1388) */
    Sn_DPORTR[0:1] = {0x13, 0x88};
```

```
/* set CONNECT Command */
Sn_CR = CONNECT;
while(Sn_CR != 0x00); /* wait until CONNECT Command is cleared*/
goto ESTABLISHED?;
}
```

#### • ESTABLISHED?

'TCP CLIENT' is in Sn\_SR (SOCK\_SYNSENT) until receiving SYN/ACK Packet from 'TCP SERVER' against of SYN Packet transmitted. If SYN/ACK Packet is received from 'TCP SERVER', the Connection Process between 'TCP SERVER' and 'TCP CLIENT' is completed.

If there is no response from Peer against of transmitted SYN Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

(Ref 4.3.1 TCP Server : Received DATA?)

#### • Others flow

Refer to 4.3.1 TCP Server.

#### 4.3.3 Other Functions

#### 4.3.3.1 TCP SOCKET Options

Before Sn\_CR [OPEN] is set to '1', SOCKET Option can be set by Sn\_MR and Sn\_MR2.

#### • No Delayed ACK: Sn\_MR [NDACK] = '1'

If No Delayed ACK option is set, SOCKET sends ACK Packet against of Peer Data Packet without Delay.

#### • Delayed ACK: Sn\_MR [NDACK] = '0'

If No Delayed ACK option is not set, SOCKET sends ACK Packet against of Peer Data Packet after RTR or TCP Window Size increased.

#### • Force PSH: Sn\_MR2 [BRDB]='1'

If Force PSH option is set, SOCKET puts PSH flag in every Data Packet to be transmitted.

#### Auto PSH: Sn\_MR2 [BRDB ]='0'

If Force PSH option is not set, SOCKET puts PSH flag in the last Data Packet to be transmitted.

#### 4.3.3.2 Keep Alive

Keep Alive (KA) is a message sent by Peer to check that the link is operating, or to prevent the link from being broken. Keep Alive sends the last 1 Byte from the last transmitted Data. So, Data bigger than 1 Byte must be transmitted before Keep Alive.

If there is no response from Peer against of KA Packet within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

The period of KA Packet transmit is set by Sn\_KPALVTR. If Sn\_KPALVTR is zero, KA Packet is able to be transmitted by Sn\_CR [SEND\_KEEP].

#### 4.4 UDP

UDP (User Datagram Protocol) is a Datagram Communication Protocol and doesn't guarantee the stability in Transport Layer above the IP Layer. It also provides Communication between Applications using Port Numbers. UDP can communicate with more than one Peer and doesn't require the Connection Process. On the other hand, UDP has Data Loss and receives Data from any Peers because UDP has no guarantee reliability. UDP Transmission Methods are Unicast, Broadcast and Multicast according to Data transmit/receive range.

Figure 8 shows UDP Operation Flow.

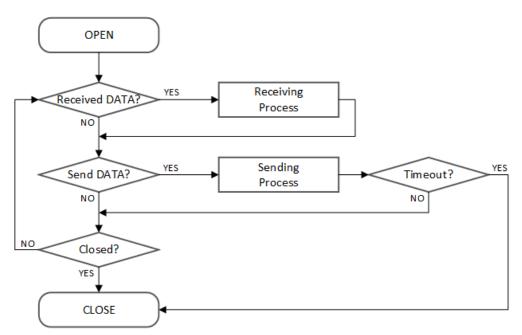

Figure 8 UDP Operation Flow

#### 4.4.1 UDP Unicast

UDP Unicast is the first Communication Method in which sender is one and receiver is one. Before Data Transmit, SOCKET performs the ARP Process. In the ARP Process, if there is no response from Peer against of ARP Request within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'. (Ref 4.8.1 ARP & PING Retransmission)

If previous Destination and current Destination are the same, the ARP Process is skipped. Also, the ARP Process is skipped by Sn\_CR [SEND\_MAD] and Sn\_DHAR.

#### • OPEN

SOCKET n is configured as UDP Mode by OPEN Command.

{

```
START:

/* set UDP Mode */

Sn_MR[3:0] = '0010';

/* set Source PORT Number, 5000(0x1388) */

Sn_PORTR[0:1] = {0x13, 0x88};

/* set SOCKET Option such as Broadcast Block. */

// refer to 3.2.23 Sn_MR2 (SOCKET n Mode register 2)

// Sn_MR2[BRDB] = '1';

/* set OPEN Command */

Sn_CR = OPEN;

while(Sn_CR != 0x00); /* wait until OPEN Command is cleared*/

/* check SOCKET for UDP Mode */

if(Sn_SR != SOCK_UDP) goto START;
}
```

#### • Received DATA?

Refer to 4.3.1 TCP Server: Received DATA?

#### • Receiving Process

UDP Mode SOCKET can receive Data Packets from more than one Peer. The received Data Packet is stored in SOCKET n RX Buffer Block with "PACKET INFO" as shown in Figure 9. If the received Data is bigger than SOCKET n RX Buffer Free Size, it is discarded.

(Ref 4.3.1 TCP Server: Receiving Process)

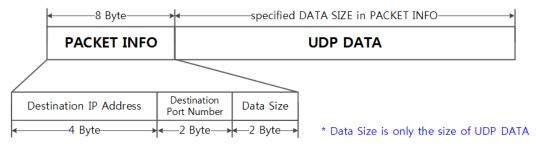

Figure 9 Received UDP DATA in SOCKETn RX Buffer Block

```
{
    /* receive PACKINFO */
```

```
goto 4.3.1 TCP Server : Receiving Process with get_size = 8;

/* extract Destination IP, Port, Size in PACKET INFO*/
dest_ip[0:3] = destination_address[0:3];
dest_port = (destination_address[4] << 8) + destination_address[5];
data_size = (destination_address[6] << 8) + destination_address[7];

/* read UDP Data */
goto 4.3.1 TCP Server : Receiving Process with get_size = data_size;
}</pre>
```

#### • Send DATA? / Sending Process

Refer to 4.3.1 TCP Server: Send DATA? / Sending Process.

```
{
    /* set Destination IP Address, 192.168.0.11 */
    Sn_DIPR[0:3] = {0xC0, 0xA8, 0x00, 0x0B};

    /* set Destination PORT Number, 5000(0x1388) */
    Sn_PORTR[0:1] = {0x13, 0x88};

    /* for using SEND_MAC Command : */
    // refer to 4.4.4.1 UDP MAC Send
    /* set Destination MAC Address, 11:22:33:AA:BB:CC
        Sn_DHAR[0:5] = {0x11, 0x22, 0x33, 0xAA, 0xBB, 0xCC};
    */
    goto 4.3.1 TCP Server : Sending Process;

    /* for using SEND_MAC Command : */
    // refer to 4.4.4.1 UDP MAC Send
    /*
        goto 4.3.1 TCP Server : Sending Process replaced Sn_CR[SEND] with
        Sn_CR[SEND_MAC];
    */
}
```

#### • Timeout?

If Data packet is transmitted to Peer at the first time or the Peer to be received Data Packet is different from the last Peer, the ARP process is performed before transmitting Data packet.

In the ARP Process, if there is no response from Peer against of ARP Request within the Retransmission Time, Sn\_IR [TIMEOUT] is set to '1'.

UDP Mode SOCKET does not closed with Sn\_IR [TIMEOUT] because it supports 1:N Communication. (Ref 4.8.1 ARP & PING Retransmission)

#### CLOSE

Closed by Sn\_CR [CLOSED].

```
{
    /* set CLOSE Command */
    Sn_CR = CLOSE;
    while(Sn_CR != 0x00); /* wait until CLOSE Command is cleared*/

    /* wait until SOCKET n is closed */
    while(Sn_SR == SOCK_CLOSED);
}
```

#### 4.4.2 UDP Broadcast

UDP Broadcast is the second Communication Method in which a sender transmits data to all of the same band. There are two types of Broadcasting. All Node Broadcasting for all Node in Network and Subnet Broadcasting for the Nodes having the same Subnet in Network.

#### • Send DATA? / Sending Process

In UDP Mode, when data is transmitted using Broadcast, Sn\_DIPR must be set to Broadcast Address of the same band before Sn\_CR [SEND] Command.

```
All Node Broadcasting:
```

```
/* set Broadcast Address, 255.255.255.255.255 */
Sn_DIPR[0:3] = {0xFF, 0xFF, 0xFF, 0xFF};

/* set Destination PORT Number, 5000(0x1388) */
Sn_PORTR[0:1] = {0x13,0x88};

goto 4.3.1 TCP Server : Sending Process;
}

Subnet Broadcasting : Assume SIPR = "192.168.0.10" & SUBR = "255.255.255.0"
{
    /* set Broadcast Address, 192.168.0.255 */
    Sn_DIPR[0:3] = {0xC0, 0xA8, 0x00, 0xFF};

    /* set Destination PORT Number, 5000(0x1388) */
    Sn_PORTR[0:1] = {0x13,0x88};

    goto 4.3.1TCP Server : Sending Process;
}
```

#### 4.4.3 UDP Multicast

UDP Multicast is the last Communication Method in which sender is one and receiver is a group. The Multicast-Group Address Range is 224.0.0.0 ~ 239.255.255.255 (Ref *IANA\_Multicast Address*) and the corresponding MAC Address is 01:00:5E:00:00:00 ~ 01:00:5E:FF:FF:FF . The Lower 23 bits of MAC Address has the same Address with the Multicast-Group Address. (Ref *rfc1112*)

#### • OPEN

Before Sn\_CR [OPEN] Command, Multicast-Group Information and Sn\_MR [MULTI] must be set. IGMP (Internet Group Management Protocol) JOIN message is transmitted by Sn\_CR [OPEN] Command.

IGMP version is set as version 1 or version 2 by Sn\_MR [MS].

```
{
START:
    /* set Multicast-Group MAC Address, 01:00:5E:00:00:64 */
Sn_DHAR[0:5] = {0x01, 0x00, 0x5E, 0x00, 0x00, 0x64};

/* set Multicast-Group IP Address, 224.0.0.100 */
```

```
Sn_DIPR[0:3] = \{0xE0, 0x00, 0x00, 0x64\};
    /* set Multicast-Group PORT Number, 3000(0x0BB8) */
    Sn_DPORTR[0:1] = \{0x0B, 0xB8\};
    /* set UDP Multicast */
    Sn_MR[MULTI] = '1';
    /* set IGMP Version */
    Sn_MR[MC] = '1'; /* Sn_MR[MC] = '1' : IGMPv1 , Sn_MR[MC] = '0' : IGMPv2 */
    /* set SOCKET Option such as Unicast Block and Broadcast Block.
     refer to 3.2.23 Sn_MR2 (SOCKET n Mode register 2) */
    // Sn_MR2[UNIB] = '1';
    // Sn_MR2[BRDB] = '1';
    /* set UDP Mode */
    Sn_MR[3:0] = 4'b0010;
    /* set Source PORT Number, 3000(0x0BB8) */
    Sn_PORTR[0:1] = \{0x0B, 0xB8\};
    /* set OPEN Command */
    Sn_CR = OPEN;
    /* check SOCKET for UDP Mode */
    if(Sn_SR != SOCK_UDP) goto START;
}
```

#### • Send DATA? / Sending Process

Refer to 4.3.1TCP Server: Sending Process

### 4.4.4 Other Functions

### 4.4.4.1 UDP MAC Send

When Peer MAC Address is known, UDP Mode SOCKET transmits Data Packet without the ARP Process by setting Sn\_DHAR.

(Ref 4.4.1 UDP Unicast: Send DATA? / Sending Process)

## 4.4.4.2 UDP SOCKET Options

In UDP Mode, Unicast and Broadcast Packets are received. But if Sn\_MR2 [BRDB] is set to '1', Broadcast Packet is blocked.

In UDP Multicast Mode, Unicast, Broadcast and Multicast Packets are received. But if Sn\_MR2 [UNIB] or Sn\_MR2 [BRDB] are set to '1', Unicast or Broadcast Packets are blocked.

These Block Bits must be set before Sn\_CR [OPEN] Command.

Sn_MR[MULTI]	Sn_MR2[BRDB]	Sn_MR2[UNIB]	Unicast	Multicast	Broadcast
0	0	Don't Care	0	Х	0
0	1	Don't Care	0	Х	Х
1	0	0	0	0	0
1	0	1	Χ	0	0
1	1	0	0	0	Х
1	1	1	Х	0	Х

### 4.4.4.3 Port Unreachable Block

If Peer transmits UDP Packet to a Port that does not exist on W5100S. W5100S automatically transmits ICMP Packet (Destination Port Unreachable) to Peer. But it could be the target for Port Scan Attack. But if MR2 [UDPURB] is set to '1', W5100S does not transmit ICMP Packet (Destination Port Unreachable).

## 4.5 IPRAW

IPRAW Mode SOCKET supports Internet Protocol (IPv4) Layer Communication and Internet Protocol is set by Sn\_PROTOR. (Ref <u>IANA\_Protocol Number</u>)

IPRAW Mode SOCKET does not support IPv6, TCP and UDP.

Protocol	Number	Semantic	W5100S Support
ICMP	1	Internet Control Message Protocol	0
IGMP	2	Internet Group Management	0
IPv4	4	IPv4 encapsulation	0
ТСР	6	Transmission Control	X
UDP	17	User Datagram	X
IPv6	-	Protocols over IPv6	X
others	-	Other Protocols	0

Table 5 Internet Protocol Supported In IPRAW Mode

If IPRAW Mode SOCKET is opened and Sn\_PROTOR is set to ICMP, W5100S does not send PING Reply against of Peer PING Request and IPRAW Mode SOCKET stores Peer PING Request Packet in SOCKET RX Buffer Block.

Figure 10 shows IPRAW Mode SOCKET Operation Flow.

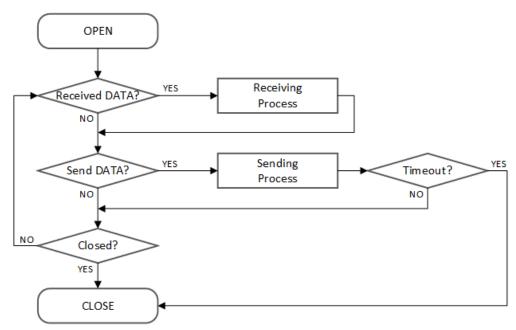

Figure 10 IPRAW Operation Flow

#### OPEN

IPRAW Mode SOCKET is opened.

```
{
START:
    /* set Protocol Number */
    Sn_PROTOR = protocol_num;

    /* set IPRAW Mode */
    Sn_MR[3:0] = "0011";

    /* set OPEN Command */
    Sn_CR[OPEN] = '1';
    while(Sn_CR != 0x00); /* wait until OPEN Command is cleared*/

    /* check SOCKET for IPRAW Mode */
    if(Sn_SR != SOCK_IPRAW) goto START;
}
```

#### Received DATA?

Refer to 4.3.1 TCP Server: Received DATA?

#### Receiving Process

IPRAW Mode SOCKET receives Data Packet using the same Internet Protocol from any Peer. IPRAW Mode SOCKET stores Data including "PACKET INFO" in SOCKET RX Buffer Block as the below Figure 11. If the received Data is bigger than SOCKET n RX Buffer Free Size, it is discarded.

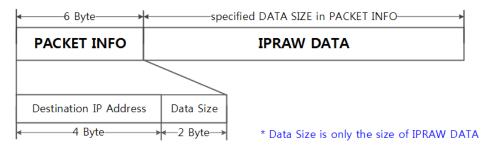

Figure 11 Received Data in IPRAW Mode SOCKET RX Buffer Block

```
{
  /* receive PACKINFO */
  goto 4.3.1TCP Server : Receiving Process with get_size = 6;

  /* extract Destination IP, Size in PACKET INFO*/
  dest_ip[0:3] = destination_address[0:3];
  data_size = (destination_address[4] << 8) + destination_address[5];</pre>
```

```
/* read UDP Data */
goto 4.3.1 TCP Server : Receiving Process with get_size = data_size;
}
```

#### • Sending DATA? / Sending Process

Data to be transmitted must not exceeded SOCKET n TX Buffer Free Size. If the Data is bigger than IPRAW MSS, HOST must separate Data smaller than MSS.

```
{
    /* set Destination IP Address, 192.168.0.11 */
    Sn_DIPR[0:3] = {0xC0, 0xA8, 0x00, 0x0B};

    /* for using SEND_MAC Command :
    refer to 4.4.4.1 UDP MAC Send */
    /* set Destination MAC Address, 11:22:33:AA:BB:CC
    Sn_DHAR[0:5] = {0x11, 0x22, 0x33, 0xAA, 0xBB, 0xCC};
    */
    goto 4.3.1 TCP Server : Sending Process;

    /* for using SEND_MAC Command :
    refer to 4.4.4.1 UDP MAC Send */
    /*
        goto 4.3.1 TCP Server : Sending Process replaced Sn_CR[SEND] with
        Sn_CR[SEND_MAC];
    */
}
```

#### • Timeout?

Refer to 4.4.1 UDP Unicast: Timeout?

### 4.6 MACRAW

MACRAW Mode supports Data Communication in Ethernet MAC and it is only using SOCKET 0. MACRAW Mode SOCKET 0 receives all Ethernet Packet or receiving Ethernet Packet (as Broadcast, Multicast and a Data Packet having the same Destination MAC Address with SHAR) is restricted by Sn\_MR [MR]. And also Sn\_MR2 can block receiving Broadcast, Multicast and IPv6 Packet.

MACRAW Mode SOCKET 0 does not receive any Data Packet for other SOCKET but it receives ARP Request and PING Request (If IPRAW Mode SOCKET does not support ICMP). Even though MACRAW Mode SOCKET 0 receives ARP and PING Request, W5100S transmits automatically ARP and PING Reply.

Figure 12 shows MACRAW Mode SOCKET 0 Operation Flow.

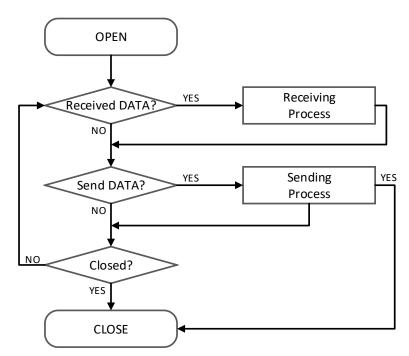

Figure 12 MACRAW Operation Flow

#### OPEN

MACRAW Mode SOCKET 0 is opened.

```
{
START:
   /* set MACRAW Mode */
S0_MR = "0100";

/* MACRAW SOCKET Options */
   /*
```

```
SO_MR[MR] = '1';  // Enable MAC Filter

SO_MR2[MBBLK] = '1';  // Broadcast Packet Block

SO_MR2[MMBLK] = '1';  // Multicast Packet Block

SO_MR2[IPV6BLK] = '1';  // IPv6 Packet Block

*/

/* set OPEN Command */

SO_CR = OPEN;

while(Sn_CR != 0x00); /* wait until OPEN Command is cleared*/

/* check SOCKET0 is MACRAW Mode */

if(SO_SR != SOCK_MACRAW) SO_CR = CLOSE; goto START;

}
```

#### • Received DATA?

Refer to 4.3.1 TCP Server: Received DATA?

#### • Receiving Process

MACRAW Mode SOCKET 0 receives Data Packet from more than one Peers. MACRAW Mode SOCKET 0 stores Data including "PACKET INFO" in the SOCKET 0 RX Buffer Block as shown in Figure 13.

#### **PACKET INFO**

#### MACRAW DATA

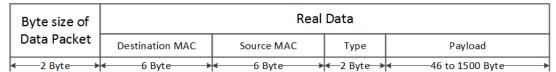

Figure 13 Received DATA Format in MACRAW

```
{
    /* receive PACKINFO */
    goto 4.3.1 TCP Server : Receiving Process with get_size = 2;

    /* extract Size in PACKET INFO*/
    data_size = (destination_address[0] << 8) + destination_address[1];

    /* read UDP Data */
    goto 4.3.1 TCP Server : Receiving Process with get_size = data_size;
}</pre>
```

### • Sending DATA? / Sending Process

Data to be transmitted must not be exceeded SOCKET 0 TX Buffer size. If Data is bigger than MSS, it must be divided by MSS and transmitted. If transmitting Data is smaller than 60byte, the Data is Zero Padding to 60 Bytes. (Ref 4.3.1 TCP Server: Send DATA? / Sending Process)

#### • CLOSE

Refer to 4.4.1 UDP Unicast: CLOSE

## 4.7 SOCKET-less Command (SLCR)

SOCKET-less Command (SLCR) transmits ARP Request and PING Request by SLCR [ARP] = '1' and SLCR [PING] = '1' without SOCKET OPEN.

If ARP and PING Reply are received from Peer, SLIR [ARP] and SLIR [PING] are set to '1'. But if there is no response against of each Requests within SOCKET-less Retransmission Time, TIMEOUT is occurred (SLIR [TIMEOUT] = '1'). (Ref 4.8.1 ARP & PING Retransmission)

Figure 14 shows SOCKET-less Command Operation Flow.

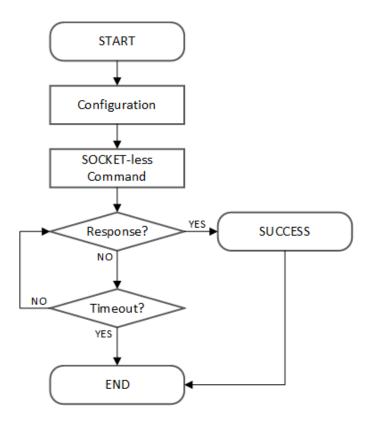

Figure 14 SOCKET-less Command Operation Flow

# 4.7.1 ARP Request (SLCR [ARP] = '1')

ARP Request Packet is transmitted by SLCR [ARP] Command. Before SLCR [ARP] Command, Peer IP Address must be set in SLPIPR. If ARP Reply is received from Peer, SLIR [ARP] is set to '1' and Peer MAC Address is written in SLPHAR. If there is no response against of ARP Request within SOCKET-less Retransmission Time, SLIR [TIMEOUT] is set to '1'. (Ref 4.8.1 ARP & PING Retransmission)

#### • Configuration

Configure SOCKET-less Retransmission Time and ARP Interrupt Mask Bit and Destination Peer IP Address.

#### • SOCKET-less Command

ARP Request Packet is transmitted by ARP Command.

```
{
  /* set ARP Command */
  SLCR[ARP] = '1';
  while(SLCR != 0x00); /* wait until ARP Command is completed*/
}
```

#### • Response?

ARP Interrupt indicates whether ARP Reply has been received.

#### • Timeout?

If there is no response from Peer against of transmitted ARP Request Packet within the Retransmission Time, TIMEOUT Interrupt is occurred. (Ref 4.8.1 ARP & PING Retransmission)

```
{
    /* check TIMEOUT Interrupt */
    if(SLIR[TIMEOUT] == 1)
    {
        /* clear Interrupt */
        SLIR[TIMEOUT] = '1';
        goto END;
    }
    else goto Response;
}
```

#### SUCCESS

If ARP Reply is received, Peer MAC Address is stored in SLPHAR.

```
{
    /* get Destination MAC Address */
    destination_mac[0:5] = SLPHAR[0:5];
    goto END;
}
```

# 4.7.2 PING Command (SLCR [PING] = '1')

PING Request Packet is transmitted by SLCR [PING] Command. Before SLCR [PING] Command, SLPIPR, PINGSEQR and PINGIDR must be set. If PING Reply is received from Peer, SLIR [PING] is set to '1' and Peer MAC Address is written in SLPHAR. If there is no response against of PING Request within SOCKET-less Retransmission Time, SLIR [TIMEOUT] is set to '1'. (Ref 4.8.1 ARP & PING Retransmission)

#### • Configuration

Configure SOCKET-less Retransmission Time and PING Interrupt Mask Bit and Destination Peer IP Address.

```
{
START:
   /* set SOCKET-less Retransmission Time, 100ms(0x03E8) (The unit is 100us) */
SLRTR[0:1] ={ 0x03, 0xE8};
```

```
/* set SOCKET-less Retransmission Counter, 5 */
SLRCR = 0x05;

/* set Interrupt Mask Bit */
SLIMR[PING] = '1'; // PING Interrupt Mask Bit
SLIMR[TIMEOUT] = '1'; // TIMEOUT Interrupt Mask Bit

/* set Destination IP Address, 192.168.0.100 */
SLPIPR[0:3] = {0xC0, 0xA8, 0x00, 0x64};

/* set PING Sequence Number, 1000(0x03E8) */
PINGSEQR[0:1] = {0x03, 0xE8};

/* set PING ID, 256(0x0100) */
PINGIDR[0:1] = {0x01,0x00};
}
```

#### • SOCKET-less Command

PING Request Packet is transmitted by PING Command.

```
{
    /* set PING Command */
    SLCR[PING] = '1';
    while(SLCR != 0x00); /* Wait until PING Command is completed*/
}
```

#### • Response?

PING Interrupt indicates whether PING Reply has been received.

## • Timeout? / SUCCESS

Refer to 4.7.1 ARP Request (SLCR [ARP] = '1') Timeout? / SUCCESS.

### 4.8 Retransmission

#### 4.8.1 ARP & PING Retransmission

When there is no Response from Peer against of ARP or PING Request Packet, ARP & PING Retransmission is performed.

In Retransmission Process, Request Packet is retransmitted every RTR until the Response Packet received. And if the number of Retransmission exceeds RCR, TIMEOUT occurs for the Request Packet.

The below table shows Retransmission TIMEOUT ( $ARP_{TO}$ ,  $PING_{TO}$ ).

$$ARP_{TO}$$
,  $PING_{TO} = (TIMEOUT_{VAL} \times 0.1 ms) \times (TIMEOUT_{CNT} + 1)$ 

TIMEOUT<sub>VAL</sub> = SLRTR or Sn\_RTR

 $TIMEOUT_{CNT} = SLRCR \text{ or } Sn\_RCR$ 

Ex) TIMEOUT<sub>VAL</sub> = 2000(0x07D0), TIMEOUT<sub>CNT</sub> = 8(0x0008)  

$$ARP_{TO}$$
= 2000 X 0.1ms X 9 = 1.8s

 $ARP_{TO}$  is caused by SLCR [ARP], Sn\_CR [SEND] and Sn\_CR [CONNECT]. And it is checked through SLIR [TIMEOUT] or Sn\_IR [TIMEOUT].

PING<sub>TO</sub> is caused by SLCR [PING] and is checked through SLCR [TIMEOUT].

### 4.8.2 TCP Retransmission

When TCP Mode SOCKET does not receive ACK Packet from Peer against of SYN, FIN or DATA Packet sent, TCP Retransmission is performed.

In TCP Retransmission process, Request Packet is retransmitted every Sn\_RTR until Peer ACK Packet received. And if the number of Retransmission exceeds Sn\_RCR, SOCKET n TIMEOUT occurs.

The below table shows TCP Retransmission TIMEOUT ( $TCP_{TO}$ ).

$$\text{TCP}_{\text{TO}} = \left(\sum_{N=0}^{M} (\text{TIMEOUT}_{\text{VAL}} \times 2^{N}) + ((\text{TIMEOUT}_{\text{CNT}} - M) \times \text{TIMEOUT}_{\text{MAXVAL}})\right) \times 0.1 \text{ms}$$

N: Number of Retransmission,  $0 \le N \le M$ 

M: Minimum value of TIMEOUT<sub>VAL</sub>  $\times$  2<sup>(M+1)</sup> >65535 and 0  $\leq$  M  $\leq$  TIMEOUT<sub>CNT</sub>

TIMEOUT<sub>VAL</sub> = SLRTR or Sn\_RTR

 $TIMEOUT_{CNT} = SLRCR \text{ or } Sn\_RCR$ 

TIMEOUT<sub>MAXVAL</sub>: TIMEOUT<sub>VAL</sub> $\times$  2<sup>M</sup>

Ex) RTR = 2000(0x07D0), RCR = 8(0x0008)

 $TCP_{TO}$  = (0x07D0+0x0FA0+0x1F40+0x3E80+0x7D00+0xFA00+0xFA00+0xFA00+0xFA00) X 0.1ms = (2000 + 4000 + 8000 + 16000 + 32000 + ((8 - 4) X 64000)) X 0.1ms = 318000 X 0.1ms = 31.8s

 $TCP_{TO}$  is occurred by CONNECT, SEND and DISCON Command in Sn\_CR and it is checked through Sn\_IR [TIMEOUT].

## 4.9 Others Function

## 4.9.1 System Clock(SYS\_CLK) Switching

SYS\_CLK is set 25MHz or 100MHz. It is switched by MR2 [CLKSEL], PHYCR0 [RST] or PHYCR1 [PWDN]. At switching Clock speed, Host must wait until stabilized SYS\_CLK. (Ref 7.4.1 Reset Timing)

MR2[CLKSEL]	PHYCR0[RST]	PHYCR1[PWDN]	SYS_CLK(MHz)
0	0	X	25
0	1	0	100 (Default)
0	1	1	25
1	Х	Х	25

## 4.9.2 Ethernet PHY Operation Mode Configuration

PHY Operation Mode (Speed, Duplex) set by PHYCR0 is applied after Ethernet PHY H/W Reset. Set PHY Operation Mode is checked through PHYSR [5:3] and the state of Link is described on PHYSR [2:0] after Ethernet PHY Link Up.

Before PHYCR0 is set, PHYLCKR must be unlocked.

#### Ex) How to set PHY Operation Mode

```
PHY_10FDX:

{

/* PHYCR0 & PHYCR1 Unlock */
PHYLCKR = 0x53;

/* set PHYCR0 10Mbps/Full-Duplex */
PHYCR0[DPX] = '0';  // 0 - FDX, 1 - HDX;
PHYCR0[SPD] = '1';  // 0 - 100Mbps, 1 - 10Mbps;
PHYCR0[AUTO] = '1';  // 0 - Auto-negotiation, 1 - Manual;

/* PHY Reset Process */
PHYCR1[RST] = '0';
Wait T<sub>PRST</sub>;  // refer to 7.4.1 Reset Timing

/*wait until PHY Link is up*/
while(PHYSR[LINK] != '0');

/* read PHYSR */
If ((PHYSR[DPX] == '0') & (PHYSR[SPD] == '1') & (PHYSR[AUTO] == '1') ) SUCCESS;
else FAIL;
```

```
/* PHYCR0 & PHYCR1 Lock */
PHYLCKR = 0x00; // for Lock, write any value
}
```

### 4.9.3 Ethernet PHY Parallel Detection

When Link Partner does not support Auto-negotiation, Internal Ethernet PHY forms Link through Parallel Detection.

If Duplex mode is different (such as 10F/10H), it occurs of Network performance degradation.

Link Partner PHY	Auto	10H	10F	100H	100F
Auto	100F	10H	10F	100H	100F
Auto	100F	10H	10H	100H	100H
Manual	10H	10H	10F		
10H	10H	10H	10H		
Manual	10H	10H	10F		
10F	10F	10F	10F		
Manual	100H			100H	100F
100H	100H			100H	100F
Manual	100H			100H	100F
100F	100F			100F	100F

## 4.9.4 Ethernet PHY Auto MDIX

Ethernet PHY supports Auto-negotiation and it is set by PHYCR0 [AUTO]. If Auto-negotiation is set (PHYCR0 [AUTO] = '0'), Auto-MDIX is supported and Symmetric Transformer (Figure 30 Transformer Type) is operated.

If Auto-negotiation is not set (PHYCR0 [AUTO] = '1'), Cross UTP cable must be needed because Auto-MDIX is not supported.

Ref) if either of Linked Nodes supports Auto-MDIX, Both straight and Cross UTP Cable are usable.

### 4.9.5 Ethernet PHY Power Down Mode

When PHYCR1 [PWDN] is set '1', Ethernet PHY becomes Power Down Mode and SYS\_CLK is set 25MHz.

On the other hand, if PHYCR1 [PWDN] is set '0', Ethernet PHY becomes Normal Mode and SYS\_CLK is set by MR2 [CLKSEL]. (Ref 3.1.19 MR2 (Mode Register 2))

Enter Power Down Mode:

```
/* PHYCR0 & PHYCR1 Unlock */
  PHYLCKR = 0x53;
  /* Enable Power Down Mode */
  PHYCR1[PWDN] = '1';
  /* PHYCR0 & PHYCR1 Lock */
  PHYLCKR = 0x00; // for Lock, write any value
  /* wait until clock is stable switched */
  Wait TPRST; // refer to 7.4.1 Reset Timing
}
Exit Power Down Mode:
  /* PHYCR0 & PHYCR1 Unlock */
  PHYLCKR = 0x53;
  /* enable Power Down Mode */
  PHYCR1[PWDN] = '0';
  /* PHYCR0 & PHYCR1 Lock */
  PHYLCKR = 0x00; // for Lock, write any value
  /* wait until clock is stable switched */
  Wait TPRST; // refer to 7.4.1 Reset Timing
  /* wait until clock is switched 25 to 100MHz*/
  Wait TLF; // refer to 7.4.1 Reset Timing
}
```

# 4.9.6 Ethernet PHY's Registers Control

The Registers in Ethernet PHY are accessed by MDC/MDIO (Management Data Clock / Input Output) Interface. W5100S has MDC/MDIO Controller and it is controlled by PHYDIVR, PHYRAR, PHYDOR, PHYDIR and PHYACR.

#### Ex) BMCR Write

{

```
PHYRAR = 0x00; // BMCR Address 0x00

PHYDIR = 0x80; // BMCR[15] = '1', PHY SW Reset

/* write */
PHYACR = 0x01;
while(PHYACR != 0); // wait until MDC/MDIO Control is completed
}
```

### Ex) BMSR Read

## 5 HOST Interface Mode

## 5.1 SPI Mode

When MOD [3:0] is "0000", W5100S connected to HOST via SPI Interface as shown in Figure 15. W5100S supports SPI Mode 0 and Mode 3 as shown in Figure 16. MOSI is sampling at Rising-edge, MISO is toggling at Falling-edge. MOSI and MISO are transmitted and received sequentially from MSB to LSB for each SCLK.

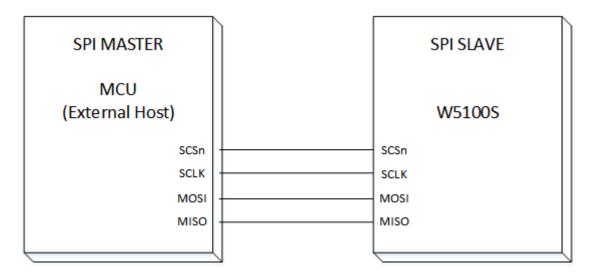

Figure 15 SCSn controlled by Host

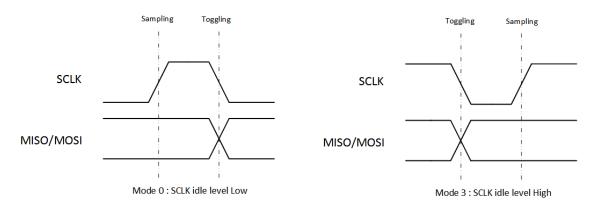

Figure 16 SPI Mode 0 & Mode 3

### 5.1.1 SPI Frame

W5100S is controlled by SPI Frame (Figure 17 SPI Frame) and is sent by HOST. SPI Frame consists of Control Phase, Address Phase and Data Phase. CSn must be controlled by SPI Frame Unit. W5100 supports only 1-Byte Data read/write but W5100S supports sequential N-Bytes (N = 1, 2, 3, ...) Data Read/Write.

Figure 17 SPI Frame

#### • Control Phase

Control Phase consists of 8bits to set Read/Write Access Type.

HOST asserts CSn from High to Low and, must after 2 SYS CLK, transmits Control Phase.

Table 6 W5100 Mode SPI Command

Access Type	Value
Write	0xF0
Read	0x0F

#### • Address Phase

Address Phase consists of 16bits to set Register Block of the W5100S or 16bits start Offset Address of TX/RX Memory Block. Start Offset Address is automatically incremented by 1 for next Data Access.

### • Data Phase

Data phase consists of N-bytes data. HOST completes Data Access, must after 2 SYS CLK, deasserts CSn from Low to High.

## 5.1.2 SPI Write

N-Bytes Date Write SPI Frame, as Shown in Figure 18

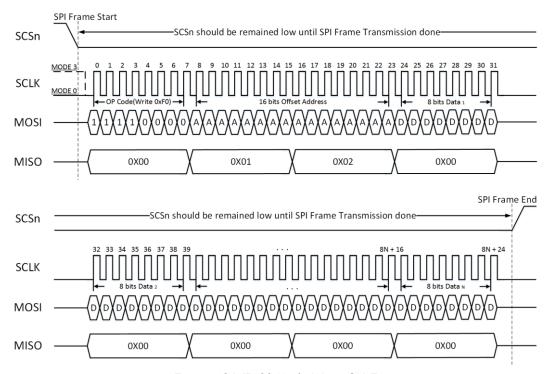

Figure 18 W5100 Mode Write SPI Frame

## 5.1.3 SPI Read

N-Bytes Date Read SPI Frame, as Shown in Figure 19

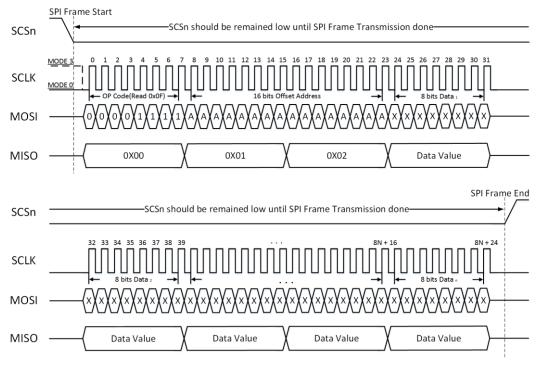

Figure 19 W5100 Mode Read SPI Frame

## 5.2 Parallel Bus Mode

When MOD [3:0] is "010X", W5100S connected to HOST via Parallel Bus Interface as shown in Figure 20.

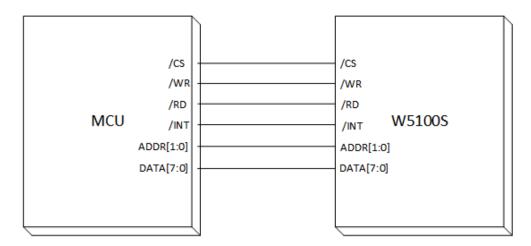

Figure 20 Direct & Indirect Mode Control by Host

Parallel Bus Interface accesses COMMON/SOCKET Register and TX/RX Memory Block of W5100S through Register in Table 7. And also Parallel Bus Interface supports N-byte sequential Data Read/Write.

ADDR[1:0]	Symbol	Description
00	MR	Common Register MR
01	IDM_ARH	Upper 8 bits Offset Address Register
10	IDM_ARL	Lower 8 bits Offset Address Register
11	IDM_DR	8 Bits Data Register

Table 7 Indirect Mode Address Value

## 5.2.1 Parallel Bus Data Write

N-byte Date write Frame, as Shown in Figure 21.

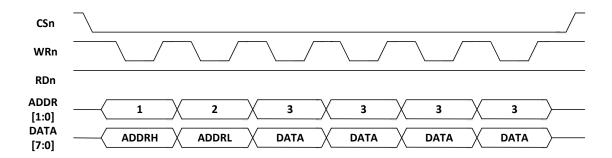

Figure 21 Parallel Bus N-Bytes Data Write

# 5.2.2 Parallel Bus Data Read

N-byte Date Read Frame, as Shown in Figure 22.

# 6 Clock & Transformer Requirements

# 6.1 Quartz Crystal requirements.

Table 8 Quartz Crystal

Parameter	Condition / Description	Min	Тур	Max	Unit
Frequency(F)			25		MHz
Frequency Tolerance	At 25°C	-50		+50	ppm
Frequency Stability	1 Year aging.	-50		+50	ppm
Load capacitance(C <sub>L</sub> )	ESR = 30 $\Omega$		12		pF
Feedback Resistor(R <sub>F</sub> )	External resistor		1M		Ω
Startup time	W5100S Reset			60	ms
Trans-conductance(g <sub>m</sub> )			8.43		mA/V
gain margin (gain <sub>margin</sub> )	gain <sub>margin</sub> = g <sub>m</sub> / g <sub>mcrit</sub>	6.99			dB

 $C_0^{(1)}$ : The Packaging Parasitic Shunt Capacitance.

 $R_F^{(2)}$ : Feedback resistor.

- CO, CL, ESR and DL are provided by the crystal manufacturer.
- The W5100S has no feedback resistor. Therefore, it must be inserted outside.

<sup>\*</sup> Crystal circuit is modeled as below Figure 23.

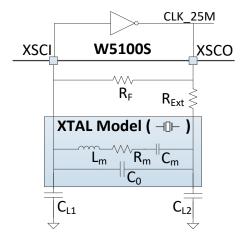

Figure 23 Quartz Crystal Model

 $C_L^{(1)}$ : Load Capacitance. eq)  $C_L = (C_{L1} \times C_{L2}) / (C_{L1} \times C_{L2}) + C_s$ 

 $C_{L1}$ ,  $C_{L2}$ : External Capacitances of the circuit connected to the crystal (Typically,  $C_{L1} = C_{L2}$ )

 $C_s$ : Stray Capacitance of printed circuit board and connections.

 $g_{mcrit}$ : Oscillator loop critical gain. eq)  $g_{mcrit} = 4 \times (ESR + R_{Ext}) \times (2\pi F)^2 \times (C_0 + C_L)^2$ 

 $ESR^{(1)}$ : Maximal equivalent series resistance. eq)  $ESR = R_m X (1 + C_0/C_L)^2$ 

 $R_{Ext}$ : Resistor for limiting the drive level(DL) of the crystal.

 $DL^{(1)}$ : The power dissipated in the crystal. Excess power can destroy the crystal.

Table 9 Crystal Recommendation Characteristics

Parameter	Range
Frequency	25 MHz
Frequency Tolerance (at 25°C)	±30 ppm
Shunt Capacitance	7pF Max
Drive Level	500uW
Load Capacitance	12pF
Aging (at 25°C)	±3ppm / year Max

# 6.2 Oscillator requirements.

Table 10 Oscillator Characteristics

Parameter	Condition / Description	Min	Тур	Max	Unit
Frequency		25		-	MHz
Frequency Tolerance	At 25°C	-50		+50	ppm
Frequency Stability	1 Year aging. 25°C	-50		+50	ppm
Clock duty	50% of waveform	45	50	55	%
Input high voltage		-	0.97	-	٧
Input low voltage		-	0.13	-	٧
Rise/Fall Time	10% to 90% of waveform			8ns	
Start up Time		-	-	10ms	
Operating volatage		1.08V	1.2V	1.32V	
Aging (at 25°C)		±3 / ye	ar Max		ppm
